SELO F.P. FILM
Extra Fine Grain Panchromatic

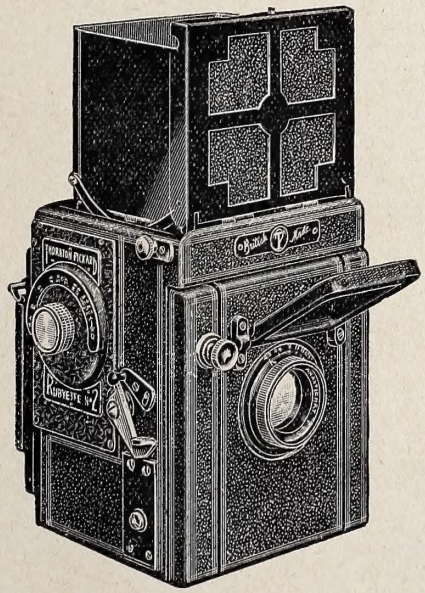
The finest of fine grain films, made specially for Leica, Contax, and similar miniature cameras.

MADE IN ENGLAND BY
ILFORD LIMITED
ILFORD · LONDON

Taken on
KODAK "VERICHROME" FILM

In brilliant holiday weather it's easy to over-expose your pictures. But it's also easy to guard against over-exposure—use "Verichrome" Film. "Verichrome" is fast, but it has enormous latitude "Verichrome" negatives yield good prints even if you use too large a stop. *You're safe with "Verichrome."*

Kodak "VERICHROME" Film



Double Coated: Anti-Halation Backed.

Made in Roll Films and Film Packs.

Obtainable from Kodak Dealers everywhere.

KODAK LIMITED · KODAK HOUSE · KINGSWAY · LONDON · W.C.2

NEW SQUARE MODEL
No. 3 RUBYETTE

TAKES 3¼-in. SQUARE PLATES AS WELL AS 3½×2½ in. PLATES and, in adapters, ROLL FILMS AND FILM PACKS.

. . is yours a 35-mm. Still Camera ?

—THEN WIN A CASH PRIZE IN THE

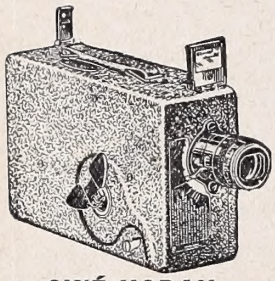
WALLACE HEATON COMPETITION

This competition is confined to pictures taken by cameras using 35-mm. film.

USERS OF LEICA, CONTAX, CONTAFLEX, RETINA, ROLLEIFLEX and ROLLEICORD (if used with ciné film) can all compete.

Open from July 1st until September 30th. It does not matter what the subject is, but prints should not be smaller than 6×4 inches.

Any number of prints can be sent in in any one week, but each photograph must have the coupon attached. In addition to the big prize, **a weekly prize of £1 1s.** will be awarded for the best photograph submitted in that week. Each photograph must have on the back a coupon as below, and the name and address of the sender, the make of camera and material used, exposure, etc. For photographs which appeal to us, not necessarily prize-winners, we reserve the right to purchase the copyright by payment of £2 2s. ; in the case of weekly prize-winners by the payment of an extra 21/-. The copyright of the £25 prize-winning print must be made over to us without further payment. *In addition we are offering a special prize of £1 1s. per month for the best photograph submitted depicting a person or persons using a camera purchased from Wallace Heaton Ltd. All prints will be judged at the end of the competition for the final prize of £25 cash. Acceptance of these rules and conditions is a specific condition of entry.*



NOTE NEW ADDRESS AND SEND YOUR ENTRIES TO " COMPETITION,"

WALLACE HEATON LTD.
127, NEW BOND STREET, LONDON, W.1

for the best photograph submitted during the run of the competition
£25
will be awarded

COUPON which must be attached to your entry.
WALLACE HEATON
35-mm. Film Competition.

RECORD IT WITH A CITY SALE CAMERA BARGAIN

Holidays ahead—and days full of opportunities for taking a great variety of pictures. It adds so much to the fun of a holiday if everyone can. To those wishing to swop over from 'stills' to movies, this bulletin provides an opportunity of doing so at a fraction of the normal cost. (See inside for list of second-hand cine cameras.) For those enthusiasts always in search of something new, we again provide the answer. The VERY LATEST cameras and cine equipments announced by the manufacturers are included here—and are actually in stock. Send us your cheque and your choice of apparatus will be sent by return of post. And finally our low 'second-hand' prices will enable those, whose expenditure on their hobby must be kept down to the lowest possible figures, to get a first-class instrument at a rock bottom bargain price.

EXCHANGE (1929) LTD.

Gevaert

GEVALUXE VELOURS

The most beautiful paper ever produced

The unique and striking velvet texture paper which gives life and beauty to all types of subject. Not only for the special pictures for the Autumn Exhibitions but equally for all landscape, architecture, portrait and interior work.

Prints on Gevaluxe have a depth of tonal beauty not obtainable by any other process, and a startling life-like quality of almost stereoscopic effect.

As simple to use as an ordinary bromide paper, as suitable for contact as for enlarging work, and ideal for enlargements from the very smallest of miniature negatives. *

* [*With all 35-mm. miniature cameras use the Gevaert Cartridge. Supplied in four varieties.*]

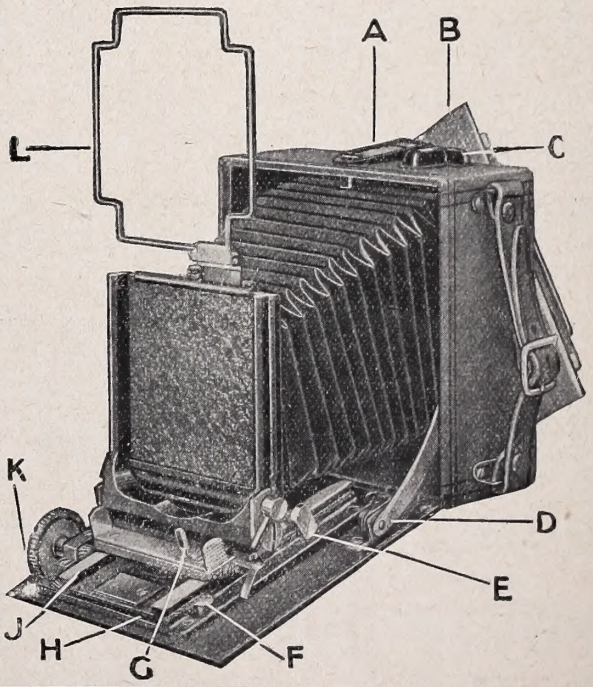
Every Adjustment You May Need



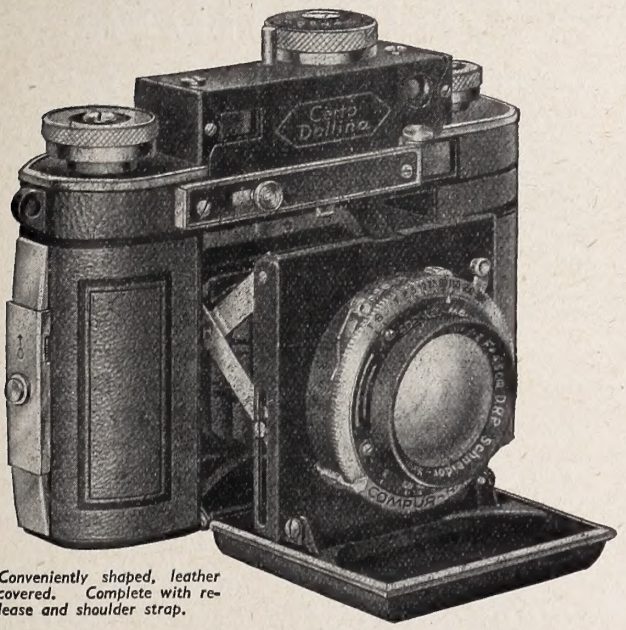
is incorporated in the

SOHO PRECISION

TRIPLE EXTENSION CAMERA

Although almost as mobile as a pocket camera, the **SOHO PRECISION** has all the advantages of a field camera, incorporating as it does every essential movement required by the serious worker in photography. All adjustments are in convenient positions, making for ease and speed of operation. The illustration gives the following details :

A. Back sight.
B. Revolving back.
C. Spirit levels.
D. Side spring clip for drop front.
E. Winder pinion for rising front.
F. Spring or releasing front for double and triple extension.
G. Clamping spring for extension.
H. Lower extension slide.
J. Upper extension slide.
K. Focussing milled wheel.
L. Eye-level finder.



The photographer who is looking for a camera easily carried yet possessing every adjustment he may need, cannot do better than investigate the possibilities of the Soho Precision. We will gladly send illustrated leaflet giving full details, free on request.

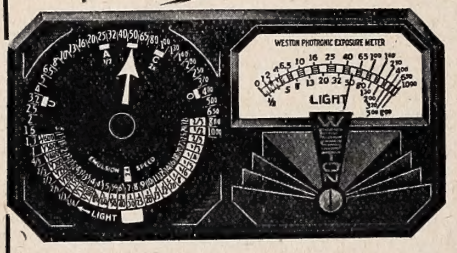
Granville PRODUCTS PRODUCE BETTER PICTURES

Whether used by the novice, the advanced worker or the professional, GRANVILLE PRODUCTS ensure the maximum results with the minimum effort. Every day we receive testimonials from new customers who are surprised and delighted—surprised at the quality obtained at such a low price—delighted with the ease in which such perfect pictures are obtained. If you are just beginning, start right with " GRANVILLE " ; if you have years of experience, change to " GRANVILLE." You will never change again !

"THE GRANVILLE GUIDE"

This new publication is a superb 16-page de luxe illustrated edition. Specially issued for users of Granville Photographic Products, it contains up-to-date working instructions, formulæ, and many useful articles specially written by our own experts. A complete list of all materials is also given, including many new lines. If you have never communicated with us before, **write to-day for your copy.** Applications should be addressed to : PUBLISHING DEPARTMENT, Granville Gulliman & Co., Ltd., P.O. Box 3, Leamington Spa.



If you have previously communicated with us, please do not apply, as a copy will be sent to you.

A Weston Meter will save all your precious shots—get one now and shoot with confidence. If you are confused by the un-corelated film ratings of H. & D., Scheiner or DIN, you can forget it if you own a Weston. All films, however rated, are tested by Weston and given a Weston number. The instruction book tells you the Weston number of the film you are using. By setting the meter accordingly, correct exposures for every kind and rating of film can be read off without calculations of any sort. So when you buy a Weston Meter you buy a complete system of film speed ratings.

Other Weston features are: Absolute permanence of the **"Photronic"** light cell—it will not vary with age, sunlight cannot harm it, and greater sensitivity—indoor shots as well as low light values out of doors. Narrow angle of view. Simpler to use. Weston quality and dependability.

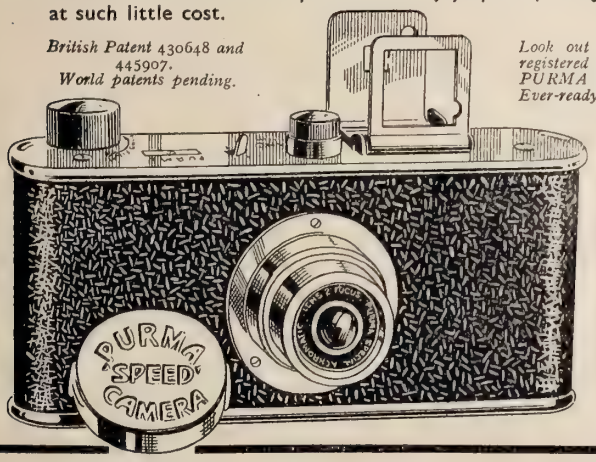
IT'S TRUE!

A MINIATURE SPEED CAMERA WITH A FOCAL PLANE SHUTTER

for



35/-

EVER-READY CASE 10/-

No longer need you envy the man with an expensive camera, able to take any and every kind of "speed" subject. Here is a camera at every man's price, equipped with the type of speed shutter which the Press photographer insists upon.

Get a Purma Speed Camera to-day and take action pictures of diving, racing, birds in flight, children at play, and the numerous other subjects which you have often attempted with an ordinary camera and failed. Six instantaneous speeds 1/25th to 1/200th sec., 16 pictures on 1/- vest-pocket roll film. No focussing necessary—everything from 6 ft. to infinity is sharply defined. Never before has it been possible to enjoy speed photography at such little cost.

British Patent 430648 and 445907. World patents pending.

Look out for the registered name PURMA on the Ever-ready case.

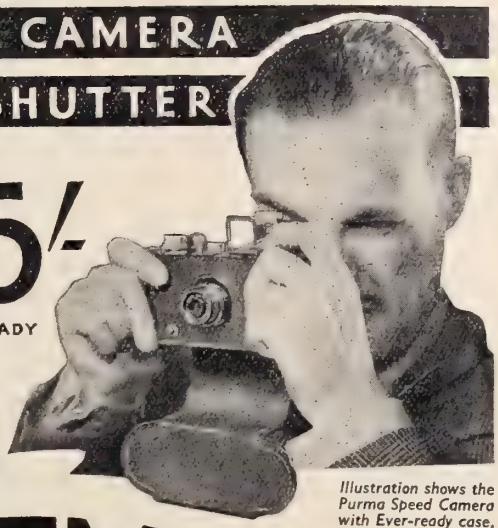


Illustration shows the Purma Speed Camera with Ever-ready case, in action.

This anent LEICA—and the WESTMINSTER

● With just one and the same LEICA Camera you can do an infinite variety of work—covering virtually the whole range of photography. That, in itself, makes for much saving of time, trouble, space, labour in carrying, and cash. Thus, for the price of your LEICA you are gaining many advantages — advantages especially typical of LEICA.

● ● By a call at "the Westminster" you can learn with pleasure all that there is to know about LEICA. At the same time you can know how (readily and economically) you can Part-Exchange your present Camera for a LEICA, settling any balance Out-of-Income—or, of course, you can buy outright on that basis.

● ● ●

This is the LEICA Model IIIa, having shutter speeds up to 1/1,000th of a second, f/2 Summar lens, and, of course, completely automatic focussing. It costs £43, or can be acquired by 9 monthly payments of £5 0 4. There are other models from £16.

Miniature Cameras

A PART-EXCHANGE OFFER

The response to our previous advertisements in this connection has been almost more than we bargained for, and we may have to withdraw our offer in the near future. However, this week we again repeat it.

At this season of the year we find it sometimes difficult to obtain adequate stocks to cope with the great demand for guaranteed second-hand miniature apparatus. In an endeavour to cope with this seasonal shortage, we are prepared, in the case of customers considering the purchase of new miniature cameras such as the Leica, Contax, Exakta, Rolleiflex, etc., to quote really unprecedented part-exchange allowances on existing apparatus. We are particularly anxious, of course, to obtain the miniature cameras in which we specialise. However, in respect of any first-class apparatus not exceeding $3\frac{1}{2} \times 2\frac{1}{2}$ inches in negative size, our prices and allowances either for cash or for part-exchange will for a short period be higher than we have ever paid before. When replying, customers are requested to describe their apparatus as fully as possible, and to mark their letter or envelope, "Part-Exchange."

EXCITINGLY NEW!

THE Voigtländer RANGEFINDER BESSA

The Voigtlander Bessa is an established favourite—now comes a new model with features far in advance of its time. Like every Bessa, its trigger release, fitted under the baseboard, enables the camera to be held in both hands at eye-level. Like every Bessa, it takes half-size or full-size pictures, but this new model has the added advantage of an optically perfect rangefinder which makes accurate focussing simple and certain. A particularly pleasant "streamlined" body makes this new "slip-in-the-pocket" Bessa decidedly handy. Study its features and prices listed below—and then ask to see it at your dealers. You'll say this new "Rangefinder" Bessa is the camera event of 1936.

FEATURES IN ADVANCE OF ITS TIME VALUE IN EXCESS OF ITS PRICE

- ★ Rangefinder coupled to lens standard, automatically sets lens to correct position at every distance.
- ★ Focussing, before or after opening, by large milled wheel with engraved distances and hyperfocal chart.
- ★ Optical view-finder with mask for half-size pictures.
- ★ Yellow hinged filter attached to lens mount.
- ★ Trigger release fitted so that finger falls readily on to it after focussing.
- ★ F/3.5 Voigtlander anastigmat lens and Compur Rapid delayed-action shutter.

With Helomar (3-element) f/3.5 lens,

£16 : 10 : 0

With Skopar (4-element) f/3.5 lens, **£18 15 0**, and Heliar (5-element) f/3.5 lens, **£21 0 0**. Compur Rapid delayed-action shutter (1 to 1/400th sec.), fitted as standard.

SUMMER NUMBER

CAN THE CAMERA LIE?

A New Competition

REPEATEDLY the above question is heard in the land, and examples of "faked" photographs are produced to demonstrate that the camera *can* lie. While expressing no definite opinion, we are aware that in nearly every instance it is not the camera that has transgressed, but the photographer.

We know that in the hands of a skilful "manipulator" an innocent, straightforward negative, or combination of several, can be persuaded to present facts of which the camera and lens in the first instance had no knowledge.

For the purpose of arriving at some sort of conclusion or answer to the question "Can the camera lie?" we have arranged a new competition for readers of "The A.P."

We would first draw their attention to two articles in this issue (pages 88, 89 and 96, 97) entitled, respectively, "Pictorial Inexactitudes" and "Making the Camera See Double." In both these articles the illustrations have all been produced by straightforward photography. They are not fakes in the accepted sense of the word; the camera has recorded precisely what was in front of the lens. The same applies to the two illustrations of the juvenile cricketer on this page.

THE COMPETITION.

We are, therefore, offering prizes for the best photographic "lies," but the prints that are entered must be quite straight, and from untouched negatives. Combination prints, or prints that have been built up by cutting out other photographs and copying, or prints that have been produced by various "control" methods are not eligible for this competition. There is quite sufficient scope in the application of the optics and chemistry of photography to produce pictorial inexactitudes without recourse to hand work.

"Something wrong somewhere."

The prizes are **5 guineas, 3 guineas, 2 guineas, 1 guinea** and **10s. 6d.** They will be awarded for what are considered to be the best efforts in making the camera "untruthful."

There are no other conditions beyond those mentioned above. A special competition coupon, which will appear each week in the advertisement pages, must be affixed to the back of each print sent in. The closing date will be September 30th.

Entries should be addressed to the Editor, *The Amateur Photographer*, Dorset House, Stamford Street, S.E.1, and should be marked on the envelope "Special Competition."

"That's better."

SUCCESSFUL COLOUR PHOTOGRAPHY

Some suggestions for obtaining the best results with the new Colour Films

AT the present time there are many photographers making a first attempt at screen colour photography with Dufaycolor or Agfacolor films. The amateur who is new to this branch of work will find that he will have something to learn apart from following the technical instructions supplied by the makers, before he obtains the best results with his new material.

The photographer who has graduated to colour work after previous experience of ordinary photography is apt to imagine that when he uses colour material almost every subject becomes a possible one.

As with monochrome work, there are good and bad subjects. The distant view often appeals on account of its colour, but it will be found unsatisfactory when reduced to the dimensions of a colour film.

The best subjects for colour photography are those which cover a comparatively small area. For example, in the case of garden subjects, a far more effective picture results from a selected corner of the garden rather than the whole; a few well-grown colourful flowers instead of large masses. The colour photographer will find very early in his experience that the best subjects are those which are simple in character, and well composed.

In colour photography colour largely takes the place of shadow. In this respect colour work differs from monochrome. In the latter, masses of light and shadow are essential, in colour work not only is it difficult to render shadow, on account of the smaller margin of latitude of the film, but also, where there is much shadow, there is little colour. Shadow not only complicates exposure problems, but is not wanted.

Through the narrow margin of latitude possessed by these films the lighting of subjects for colour photography is very important. The subject should be evenly lighted, so that shadow is avoided, but this does not mean that the best results will be obtained under the most brilliant sunshine conditions.

In the case of portraits it is necessary to reduce the exposures as much as possible, on account of possible movement of the subject, but in the case of flowers, gardens, or still life, where longer exposure can be given, it will probably be found that the best results will be obtained under what may be described as "diffused lighting." The exposures may be a little longer, but the results will be far more pleasing.

Excellent portraits have been secured in the shade out of doors, during the evening hours, and if a lens of not less than f/6.3 aperture is used the exposures will be quite short.

As before pointed out, these films have a very narrow margin of exposure latitude, and correct exposure is very important. The amateur cannot be too strongly advised to use an exposure meter, and to use it with care, for although it is possible by modification of development to compensate for errors in exposure, the finest results can only be secured when the exposure is correct. This will ensure colour brilliance and also correct colours.

The merit of any colour process lies not in its ability to give an image in colours, but rather upon the accuracy of the colouring to that of the original. Modern colour films can produce results that are not only beautiful, but very true, and the secret of success is correct exposure. R. M. F.

(A note on using Kodachrome cine film is given on another page in this issue).

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

HOLIDAYS and the CAMERA

The call of the open is upon us once again with redoubled force. Holidays and bright week-ends urge us to seek pictures in the great open spaces, and so we must be prepared for all eventualities as we set off on our most important picture-hunting expeditions of the year.

NOWADAYS the kind of camera to take on a holiday has ceased to be a problem. So many and so useful are the latest models on the market that a camera suitable for anybody's taste can be acquired with a little consideration, and the compactness and efficiency of these modern little instruments go still further to prove that photography is the ideal hobby for the outdoor-lover.

What to Take.

This is the one occasion of the year when the photographer can be almost reckless with his sensitive material. Innumerable subjects will crop up along the byways, on the seashore, along the motor-roads, indeed, everywhere, and although many of these subjects will be quite unusual ones to some photographers, now is the time to get them.

It is, however, wise to keep a small notebook, and to record details of unusual exposures on unexpected and hitherto unexplored subjects, because there is always a possibility of the same kind of picture appearing, when a second attempt, based on the previous experience, will make all the difference in the world.

Nevertheless, the amateur should persevere in this respect, for little models on the seashore, or in the fields, or even round the ice-cream and toffee-apple stalls, can be the foundations of excellent pictures. It should also be borne in mind that this type of subject is a splendid one for newspaper competitions.

Landscape.

Those who take to the open road are almost sure to be led astray by the wonderful panorama that is so often laid out before them. There is a tremendous temptation to fire off exposure after exposure on great open tracts of beautiful countryside, and the results are generally very disappointing.

If panorama pictures appeal, and the apparatus for taking them is not available, the best way to satisfy the craving is to choose a fairly prominent foreground object, stop down in order to sharpen up the distant planes, though not too much, and to photograph the foreground object with the panorama as a secondary consideration. This by no means detracts from its value; indeed, in most cases, it usually adds to it.

One important point about those who travel by cycle or motor, and that is, the difficulty of deciding to stop. There is a tendency to hurry on, and by the time one has decided to stop it has become rather late, and so the subject is allowed to go by. This is a great pity, especially when on holiday, and photographic road-users should most certainly arrange their schedules so that they will have ample time for stopping to secure any subject that may arise.

For instance, one sees some small urchins precariously scrambling up a sunlit haystack. The car or the cycle is upon them before you have had time to think, and the subject is let slip because you have been undecided whether to stop or not. A good rule is to stop for everything.

Architecture.

There are few holidays more pleasant than travelling about the country in search of architectural subjects, since one not only gets splendid photographic practice, but one gets glimpses of England—or the Continent for that matter—as she used to be, and is able to image the pageantry of mediæval times.

It must be admitted that the architectural worker really does need a special camera and a tripod. He must have a rising front, and he will be well advised to have a wide-angle lens. Of course, photographs are taken without these adjuncts, but, if the desire is purely architectural, sooner or later the necessity will crop up.

Marine Work.

It is claimed that no town in England is more than a hundred miles from the sea, so that we should be a nation of marine photographers. As a matter of fact, the reverse is the case, and the proportion of good sea subjects, exclusive of harbour and dock scenes, is really very small at our exhibitions. Yacht racing is in full swing all along our extended coast-line; attractive subjects, well worth the sport of securing in proper proportion on the negative. With white sails and a blue sky, it is a subject that tries the sensitive material to its utmost capacity, but the results are worth it.

Fishing smacks, also, are extremely good subjects for the marine worker, and it is often possible to get a fine figure of a fisherman bringing his craft into harbour, by waiting right on the edge of the wall at the entrance to the sheltered water.

Human Studies.

"Genre" work should be included when referring to studies of human beings, because most of these pictures will need to tell a story forcefully and concisely. A "bathing belle" posed artistically on the beach is not half so interesting as that little crowd of kiddies anxiously examining the contents of the old salt's lobster-pot.

Let us get human nature into our snapshots, and our subjects doing something or about to do something.

A glance at the winning prints already appearing in our newspapers shows that these subjects can be a remunerative source if tackled carefully.

Carrying Apparatus.

The modern age is one wherein to carry anything more than is absolutely essential is anathema; the photographer being by no means an exception to this rule, he will want to stow his apparatus away in as small a compass as possible.

The hiker cannot do better than have his camera attached to his belt—the case can easily be fitted with a strap for this purpose.

The motor-cyclist needs a special spring or absorbent packing in his carrier bags for his camera, while, of course, the motorist can always put his instrument in the car pockets.

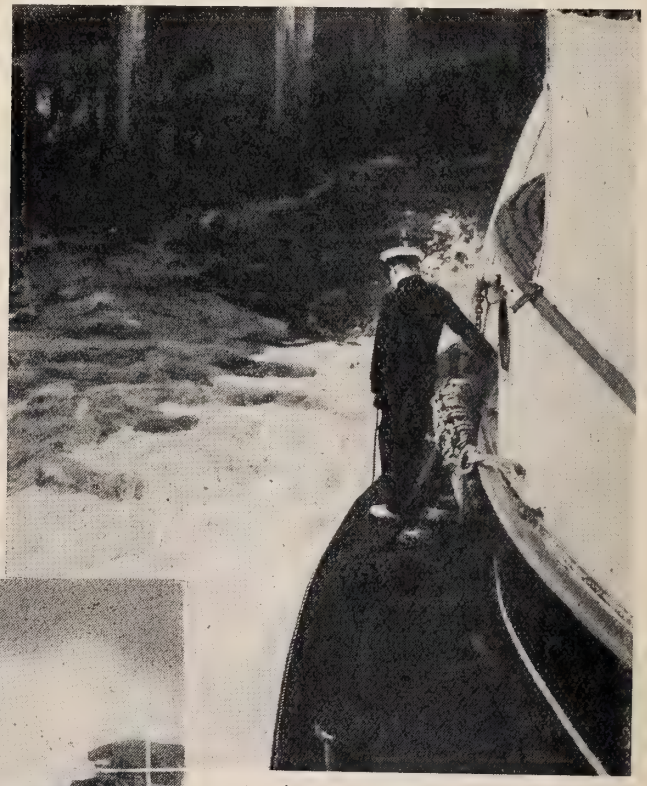
Filters take up little room, and can be stowed about the person, but tripods will require a special fitting, and it is almost certain the hiker will leave his at home unless he has one of the walking-stick variety.

Sensitive material can be procured so easily that it is quite unnecessary to carry a great deal, but it is quite a good idea to post each exposed spool of film home at once—if developing is to be done at home—so as to be out of reach of damp and other enemies to sensitive material.

Continental travellers will have little difficulty in obtaining their favourite films or plates, unless they are addicted to some very unusual brand, when they must take a supply.

Snapshots *aboard the Seaside Steamer*

By S. G. CROWDER.



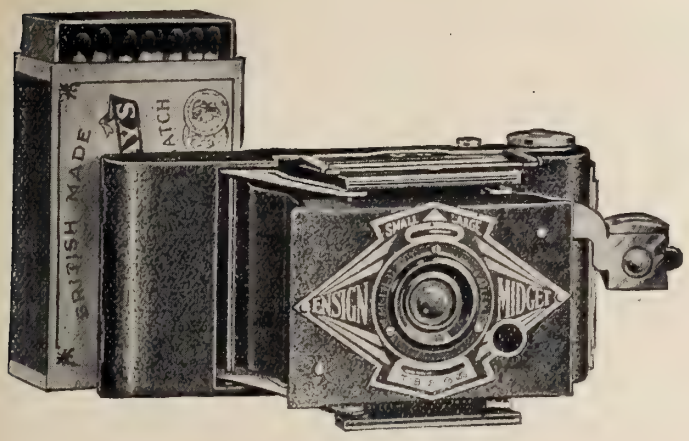
"Two points to starboard!" 1/25*th sec.*, *f*/11.

Picture stalking among the happy passengers is great fun, but the camera should be used as unobtrusively as possible. With miniature cameras of the reflex type pictures can be taken when one's back is turned towards the subject by pointing the lens underneath the arm and watching the focussing screen, but this needs much practice to be done really well.

If the sea is choppy and spray comes over the bows occasionally, the lens of the camera should be examined from time to time, and any drops of water wiped off carefully with a clean soft handkerchief.

"The receding shore." 1/25*th sec.*, *f*/11, *Panatomic film.*

"Coming alongside the pier." 1/50*th sec.*, *f*/6.3.



THE variety of photographic subjects at the seaside is legion, but too few camera users take advantage of the opportunities available for picture-making on board a pleasure steamer. The majority of our seaside resorts boast facilities for half or whole day sea trips, so that one can choose the right kind of day, when sunshine and preferably bright fleecy clouds are in evidence.

Any type of snapshot camera can be used, and fully exposed negatives can be depended upon, as the light is so good. Colour-correct film of the 'chrome type will be found excellent for this work, especially as a light colour filter can be used with them.

"Getting splashed." 1/100*th sec.*, *f*/8.

The fastest shutter speed the lens aperture will allow should be used for any rapid action pictures; anything slower than 1/50th of a second is liable to produce blur, especially as the camera is subject to movement due to sudden lurching of the vessel when well clear of the land. For stationary figures and groups on deck, however, 1/25th sec. at f/11 will generally be sufficient with a fast film.

SOME POINTS ABOUT THE ENSIGN MIDGET

The purpose behind the ENSIGN MIDGET camera was not just a small camera taking a correspondingly small size picture. It was designed for a specific purpose, namely, to place into the hands of the amateur a camera so designed and constructed that it could be worn on the person always without being noticed, and yet be capable of taking first-class pictures enlargeable to any reasonable size.

That is what the ENSIGN MIDGET does. In other words, it enables its owner to make a picture at any time and at any place where lighting conditions make it possible to take photographs at all. Thus no opportunity need ever be missed. Every amateur knows how frequently an ideal subject occurs when the camera is absent. Possession of an ENSIGN MIDGET prevents any such unfortunate occasion.

It may be argued that a camera of such limited dimensions cannot possibly be capable of taking really satisfying results. The answer is that there are now tens of thousands of satisfied owners and the percentage of first-class results obtained is abnormally high. It is an indispensable unit in the keen amateur's equipment, particularly at holiday and travelling times. If you are not already a possessor of an ENSIGN MIDGET, see one at your dealer's to-day.

Three-speed shutter, and Time. Reflex and direct-vision view-finder. Model 33, fixed focus, 3 stops. Model 55, focussing to 3 ft., iris diaphragm. Both models in leather slip case.

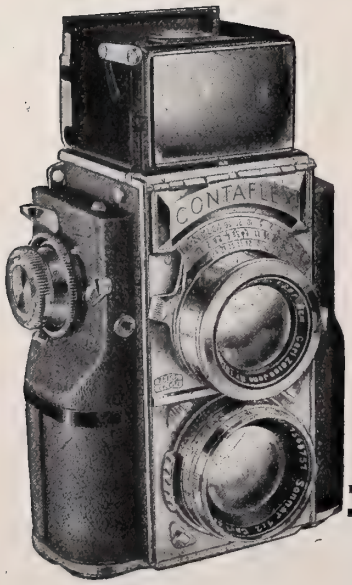
"What's that little pointer for ?"

"That's the indicator for the built-in exposure meter."



"That's a bright idea ! But how does it work ?"

"Just so, turn this lever. See how easy it is to adjust. Now the pointer is opposite the diamond shaped index mark, and here on the curved scale in front of the Contaflex is the correct exposure for any desired aperture."

"I see ; you can read off the exposure time for every lens aperture on that scale ? But is it really accurate ?"

"Perfectly. The meter is built in so that it embraces the same field of view as the normal lens on the Contaflex. You don't get that, or the extreme sensitivity, with the ordinary exposure meter."

"You certainly have made sure of getting accurately exposed negatives with the Contaflex."

Contaflex exclusive features :—

- Choice of six interchangeable Zeiss lenses, apertures from f/1.5 to f/4.
- Built-in photo-electric exposure meter.
- Focussing screen showing double-sized image with which to focus.
- Incorrodible metal focal-plane shutter speeded to a real 1/1,000th second, also delayed-action release.
- Detachable back facilitates cleaning, and permits the use of plates for scientific work.

Those desirous of further particulars are invited to ask their local stockist for a demonstration. Name of nearest stockist, together with special Contaflex booklet, free on request.

Readers' Hints, Tips and Gadgets

PARALLAX COMPENSATION ON A DIRECT-VISION VIEW-FINDER.

A RECENT article in " The A.P." on view-finders prompts the publication of a device I evolved to compensate parallax.

The ordinary D.V. finder, as fitted to many cameras to-day, has a small aperture in the rear plate, and this should have a narrow slot, say $\frac{3}{16}$-in. wide, cut in the top of it, as shown in the diagram by dotted lines. A pair of fairly stout scissors or small tinsnips will do this. The metal plate should also be slit at the corners of the aperture for about $\frac{1}{8}$ in., as shown.

The two wings are then bent outwards slightly with pliers to form a holder for a slide of thin brass. This strip must be wide enough just to slide between the bent wings and the rest of the plate, and should be a trifle longer than the finder is high. A little above its middle a hole about $\frac{1}{8}$ in. is drilled.

The camera is then fixed on a tripod and a view focussed on the screen (or, in the case of film cameras, on a piece of waxed paper in the focal plane). The slide is inserted between the wings and the top and bottom turned over with pliers to prevent its slipping out.

When the hole is central in the original aperture it is set for infinity, and should show the same view as is seen on the screen. The finder is then scaled by focussing the camera on objects placed at the various distances given on the focussing scale of the camera and observing these objects through the view-finder. The slide has to be moved away from the camera body as the distance decreases ; a pointer should be scratched on the slide and the various distances marked on the plate, or they can be written on a piece of paper gummed in position.

The finder is then ready for use, and will be accurate at all distances by moving the slide as required.

D. E. LUMB STREET.

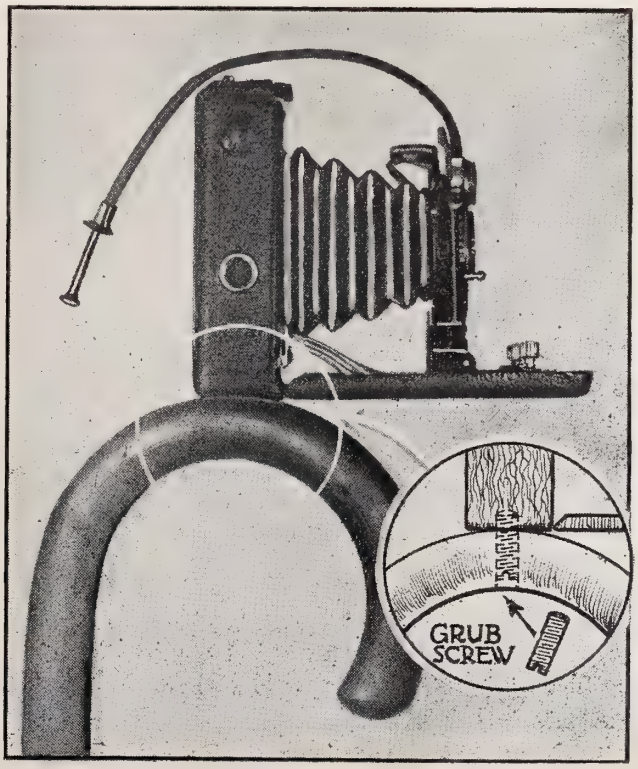
A WALKING-STICK TRIPOD FOR THE SUMMER PHOTOGRAPHER.

EVERY hand-camera user knows that there are ocasions when an exposure longer than a snapshot must be given and a stand of some sort is essential. The walking-stick tripod described below is very easy to make and the cost negligible.

A stick with crook handle is advisable, and if it does not possess a very strong ferrule it would be wise to have one fitted that is also fairly pointed.

A hole must be drilled through the centre of the handle, as shown in the accompanying sketch. The size of the hole will depend on the type of camera used. On British cameras the tripod sockets have $\frac{1}{4}$-in. Whitworth threads, but on Continental cameras the sockets usually have $\frac{3}{8}$-in. Whitworth threads. For the $\frac{1}{4}$-in. sockets we need to drill the handle with a $\frac{5}{16}$-in. drill, and for the $\frac{3}{8}$-in. sockets a $\frac{11}{32}$-in. drill.

Next, a screw tap of the required size is run through the hole. This cuts a thread in the wood, into which a slotted grub-screw is fitted. To make the grub-screw obtain a brass Whitworth threaded screw of the required size, cut off a length of the threaded part exactly equal in length to the thickness of the stick handle where hole is drilled. Then cut a slot in one end of screw to take a screw-driver.



This is plainly shown in the sketch. The grub-screw is then screwed into the threaded hole in the handle and should be placed in the position required for using as a walking-stick. Then both ends of screw should be neatly filed so that the handle will feel quite comfortable in the hand and cause no irritation to the palm.

When the stick is to be used as a camera stand, all that is necessary is to press ferruled end of stick firmly into the ground in the position required, turn the screw with a driver until two or three threads project through the top of the handle and screw camera into position, as shown in the accompanying photograph.

The point of a Yale key filed to fit the slot in the grub-screw, or even a penknife blade, would be quite suitable to use as a screw-driver.

If one is not mechanically minded enough to undertake the work entailed, a garage mechanic would willingly do so for a small fee.

J. H. L. MILES.

PHOTOGRAPHING

AT this time of the year, the thoughts of parents with children turn to holidays at the seaside, and the most delightful opportunities for snapshots are to be found amongst the groups of children playing on the beach and sands.

It will need all the photographer's skill and patience to portray them successfully, but the really good results will be an ample reward in the shape of pictures which will be a constant pleasure not only to himself but to others as well.

Indiscriminate snapshotting will not bring about this result, as each child or group of children should be studied as regards lighting, composition and background before the camera is actually brought into use. On no account should the children be made aware of the fact that they are about to be photographed, as this would be fatal to obtaining a natural result. The camera should be kept well hidden, and for that reason the modern miniature apparatus is ideal for this class of work.

My first attempts with a miniature camera were made with one of the cheapest models, which only cost me thirty shillings; this camera took sixteen pictures on a V.P. size film. The brilliant light at the seaside enabled a small stop to be used, and very sharp negatives were obtained in consequence. Many of the pictures I have obtained with this simple instrument are equal to those I now obtain with a thirty-guinea outfit. For the beginner I would advise the purchase of a camera free from unnecessary gadgets that would only lead him to disappointments.

In making studies of children at the seaside, matters are somewhat simplified by starting on your own offspring, as you do not have to stalk them as you would those of strangers. Do not, however, commit that fatal error of telling your child to "Smile for Daddy," if you want a natural picture. Children's smiles cannot be made to order but must be made to come spontaneously, and this presents little difficulty to those able to follow the curious workings of a small child's mind.

The main idea to bear in mind is to

Sand is such fun.

Serious Business.

The Young Pretender.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

CHILDREN *at the* SEASIDE

By K. REITZ.

produce "happy" snaps, and these need not necessarily be all smiling faces. Take them "doing something," such as shown in the pictures illustrating this article.

You will notice that the backgrounds in these pictures have been chosen to concentrate the actual interest on the subject. Many good seaside snaps

The First Dip of the Holiday.

are spoilt by not watching the background, by the inclusion of unwanted figures, deck-chairs and other impedimenta of the beach. The careful worker will proceed with forethought before he presses the trigger of his camera, and his efforts will be rewarded.

Photography to-day is a simple process, and if you exercise reasonable care you should have no difficulty in getting technically good results. Exposures of 1/25th of a second at f/16 will, on a sunny day at noon, or at f/11 later, give correctly exposed negatives on "Verichrome" or "Selochrome" film at the seaside.

A Seaside Silhouette.

The more advanced worker may prefer panchromatic films in conjunction with light filters, and to them I would recommend the use of an exposure reckoner or meter. For miniature cameras the Kodak "Panatomic" has my vote every time; most of the pictures herewith were taken on this fine film with a Zeiss Ikonta camera taking 16 pictures on a $3\frac{1}{4} \times 2\frac{1}{4}$ spool.

A warning note may be sounded about the care of apparatus by the sea. The camera should never be put down unprotected on the sand, and if an expensive instrument is used it should always be carried in a leather case. I speak from experience, as on one occasion, a few years ago, an expensive reflex camera I was using at the time was completely put out of action for the best part of my holiday through sand finding its way into the working parts of the mirror and shutter.

The Beach Photographer.

Going Abroad

For the benefit of those readers of "The A.P." who may be travelling to the Continent during the holiday season we give the following information regarding the admittance of photographic apparatus and materials carried by them when visiting the countries named. This information has been supplied by the various overseas Customs authorities to the British Department of Overseas Trade, and we are indebted to the Comptroller-General for the details.

It should be noted by photographers taking photographic apparatus out of this country, when going abroad for holidays, that a declaration regarding it—with description for identification—should be made at the port of embarkation, otherwise duty may be charged on it when returning to England. The necessary form is obtainable from the Customs officials at the port.

FRANCE.

Exemption from payment of duty is accorded to: Two cameras, providing they are of different makes; twelve plates *or* two roll films *or* two film packs; one sub-standard ciné camera; two rolls of film for ciné camera. Only one camera is permitted duty-free import in addition to a ciné camera.

GERMANY.

Cameras, ciné cameras and films are admitted duty-free if they are carried by tourists for their personal or professional use during their journey, or if they are sent to them in advance for this purpose or forwarded to them subsequently.

New articles of this kind are admitted free of charge as travelling requisites only if they were already in the tourist's possession abroad and if it may be supposed, judging by the quantity and nature of the articles, that they are intended for personal use during the journey.

The decision as to what quantities of new articles may be admitted free of charge is left to the Customs officers.

BELGIUM.

Used photographic apparatus carried by tourists is admitted free of duty without Customs formalities. When the apparatus is new or has the appearance of being new a deposit of the duty (15 per cent *ad valorem*) and the luxury tax (9 per cent of the duty-paid value) must be made. This deposit would be refunded on re-export. Photographic plates, films (roll films, pack film, etc.) and sensitized paper imported at the same time as the photographic apparatus for which they are intended are admitted free of duty in the following quantities: Twenty-four plates; four roll films or film packs of six exposures, or three roll films or film packs of eight exposures, or two roll films or film packs of twelve exposures.

Unexposed films for cinematographic apparatus is liable to duty as follows: Positive film 0.17 francs per metre, negative film 0.34 francs per metre, both plus a luxury tax of 9 per cent of the duty-paid value.

SWITZERLAND.

Exemption from payment of duty is accorded to: Two used cameras and twelve plates or two roll films; used cinematographic apparatus and two rolls of film. Duty is levied on new cinematographic apparatus, but if a temporary import permit (*passavant*) is obtained from the Customs authorities the amount paid is refunded when the apparatus is re-exported.

SPAIN.

Articles imported by bona-fide tourists are admitted into Spain on deposit of the duty normally payable. This deposit is returned to the tourist provided his stay does not exceed three months. It is necessary that the tourist on entering Spain should be in a position to indicate the Customs House through which he proposes to leave Spain.

PORTUGAL.

Cameras, including ciné cameras carried by passengers, as well as films in small quantities, are exempted from payment of import duties.

CZECHOSLOVAKIA.

Used cameras and twelve plates or one packet of films are admitted duty-free.

U.S.S.R.

Tourists are permitted to bring cameras with them into the Soviet Union, but only one of these articles for each family. They are admitted free of duty, but must be entered on the tourist's passport by the Customs authorities at the frontier, and must be taken out by the tourist on his departure. They must not be given to any other person for his use, either on payment or free of charge, nor presented as a gift unless the Customs duty has previously been paid.

HOLLAND.

Cameras imported by foreign tourists for their personal use and taken out of the country on their return, are generally admitted without a demand for security for Customs duty being made. If, however, the Customs authorities have doubt as to whether the articles are for the personal use of the importer, or as to whether the goods will be re-exported, and the person concerned objects to paying import duty for the goods in question, a transit passport for a maximum period of six months may be issued against deposit of the duty. After the Customs authorities have received proof of re-export the deposit is returnable.

SWEDEN.

Cameras, including ciné cameras of the Ciné-Kodak type, carried by tourists are admitted free of duty, without being subject to deposit of duty or guarantee.

There are no regulations with regard to the number of camera films which may be admitted free of duty. This would be at the discretion of the Customs officer in accordance with what he considered a reasonable supply for the personal use of the owner.

NORWAY.

It is understood that cameras, including ciné cameras of the Ciné-Kodak type, and films therefor are permitted to enter Norway duty-free when they are brought in by travelling foreigners. In general, a declaration is required from the person in question to the effect that the articles are only intended for his personal use during a short stay, and will again be carried out of the country on his departure.

LATVIA.

Used cameras and sub-standard ciné cameras, together with the respective films, are admitted free of duty.

ITALY.

Cameras, including ciné cameras of the Ciné-Kodak type, introduced into Italy by tourists coming from abroad are admitted duty-free on condition that such articles have been used and are appropriate to the financial standing of the tourist. Films for cameras or ciné cameras are liable to duty.

GREECE.

Small cameras can be imported by tourists free of duty. There are no provisions regarding the amount of films which may be admitted.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

WINDMILL *Photography*

By ASTON CLARKE.

The Mill on Wimbledon Common.

EVERY landscape photographer is aware of the added charm and interest that the inclusion of a windmill will give to his picture, and every pictorial photographer must know the thrill he gets when a windmill is sighted afar off in the landscape.

There is a fascination about the contours of these relics of the past that renders them always attractive subjects for picture-making, either as the main object of the composition or as a point of interest. Fortunately, although many of the old mills are falling into decay, and others have vanished altogether, there are still many (and some continue to work) to be found in all parts of the English countryside. A number of these are now preserved by the Society for the Protection of Ancient Buildings.

There are several types of windmills. The most picturesque is probably the post mill, the body of which is supported on a central post or other support and is revolved bodily to catch the wind. A second type is known as the smock mill.

Old Clayton Mill, South Downs.

A Yorkshire Tower Mill.

Here the body is of timber built up from the ground, and has a weather-vane and cowl to turn with the wind and alter the direction of the sails. A third type is the tower mill, the body of which is solidly constructed of brick or stone. There are also other types combining the characteristics of the three mentioned, but they are all beautiful.

The photography of windmills is not difficult. They can be taken with any type of snapshot camera, as they can generally be treated under the heading of "open landscape" subjects. It is advisable always to use colour-sensitive film and a filter, photographing them whenever possible in bright sunlight, particularly when there are clouds about.

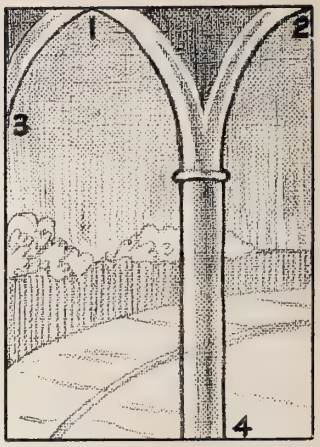
The holiday photographer can do worse than devote some time to seeking out and photographing any mill or mills in the district visited. Apart from their outstanding pictorial qualities, they will always have a value for "record" purposes.

Picture Points

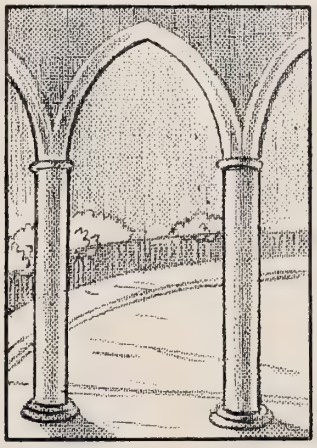
No. 9 (New Series) *by RICARDO*

Lighting for Portraiture

WHEN we are dealing with objects that are not very attractive in themselves, such as in still-life subjects, we may resort to novel and unusual lighting arrangements in order to provide them with an interesting play of light.



But when we set out to make a portrait of a person, to portray their character, to reproduce all the subtle planes of the face, then we must use the lighting that will show all this to the best advantage.

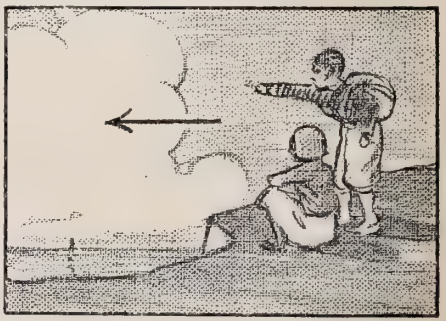


We can understand the position better by comparing the two sketches. The top one shows an angle of lighting that is certainly unusual, but that is the end of it. We cannot get any idea of the character and modelling of the sitter because the lighting is in the wrong place and predominates to an excessive degree, and the head could be a square block of wood for all the expression it conveys. We are conscious all the time of the lighting and not of the model. Although the lower sketch may suggest a commonplace lighting, it gives us a much better idea of the features, the modelling of the various planes or muscles of the face, and, above all, the character of the sitter.

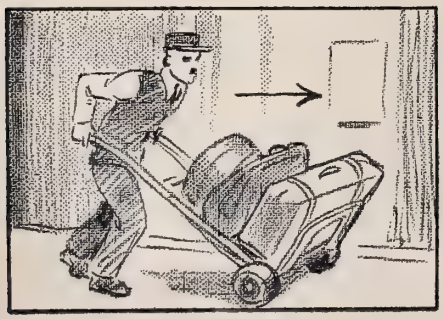
On Arches and Pillars

WE have previously discussed in this series the weakness of cutting off the " feet " of objects that are normally vertical. They tend to lose stability and balance, which is always essential for a pleasing composition and, unfortunately, the lack of such support cannot in any way be added or modified like tones or colour, etc. The advice, therefore, of always including a little more of the subject than was thought necessary is sound, because we can always trim off but can never add.

This need for steadiness and security is even more essential in architectural subjects, where we appreciate the necessity of a solid support.



If we examine the top sketch we can see immediately the weakness of the pillar without a base, 4, particularly as the tone is so light at the bottom as well. There are also pictorially weak points with the arches themselves, particularly at 3, where the arch runs into the left-hand edge and is left " hanging " with a feeling of insecurity.



At 1 and 2, where the tip of the arches just touch the trimmed edge of the print, it is rather irritating to a sensitive eye to see solid masonry becoming suddenly lopped off to such exactness. Either allow plenty of material over it or cut well into the arch. Compare this sketch with the lower one and note the improvements.

Pointing and Leading into the Picture

IN one of the previous series of " Picture Points " we saw how lines could be used as a means of directing the eye towards the main point of interest. Among the many other similar devices of attracting the attention into the picture is that of suggested motion.

If we examine the sketch of the porter and the trolley, the suggested movement towards the right urges us to look in that direction rather than to the left. Should we wish to introduce a stronger point of interest it would, therefore, be best to place it on the right instead of on the left, in order to maintain unity of direction.

Another device is that of a person pointing with the hand, and if the object of their attention is within the picture space then the value of the pointer will be even stronger. Even the action of a person or animal looking towards a certain direction is sufficient to invite our attention in the same way. The right-hand sketch illustrates both of these. It is well not to overdo the pointing idea as it can easily become rather wearisome. It suggests the dramatic that is not always in keeping with the general atmosphere of the subject.

If any of these ideas are adopted it is important to allow plenty of space in the direction of interest. To test this, cover up the trolley in the left-hand sketch and the clouds in the landscape and immediately the action becomes cramped and the attention is attracted outside the picture instead of into it.

By M. Hern.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Regatta Photography

By JOHN K. NEWBURN.

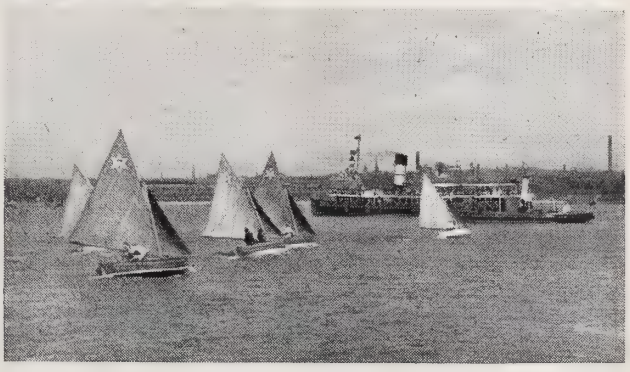
IN considering the number of yacht clubs round our coast that hold regattas during the summer months it is rather surprising there are not more yacht photographers.

This class of work possesses few technical difficulties, and even a comparatively slight knowledge of sailing will enable the amateur to spend a very enjoyable and often productive afternoon with a camera.

Yacht photography at this time of year permits the use of practically any type of camera. The subject is one that is probably the most brilliantly lighted of any outdoor subject attempted with the camera. The lens can be stopped down to, say, f/16 for almost every "shot" taken on a bright day, between 10.30 and 2, and f/11 later in the afternoon. This enables the cheapest type of snapshot camera to be used, with fast film, but no filter.

Making for the mark buoy.

Running before the wind with spinnaker set.



The regattas provide endless opportunities for pictures of yachts in action, and the smaller classes offer some wonderful groupings, particularly at the start of each race and when the boats are rounding the mark buoy.

In many cases good shots can be secured from the end of a pier, or even from the shore, especially if the photographer happens to possess a telephoto lens; but the best position from which to obtain the most satisfactory yacht pictures is on another boat. The ideal is, of course, to be on a motor boat that can follow, or pass, or circle round the racing craft, to enable the photographer to get shots at any angle and with every kind of lighting effect.

Comparative pictures showing the yachts taken against the light (a lens hood is, of course, necessary for this) or with the light shining on the sails provide excellent pictorial variations of the same subject.

The photographs accompanying this note are some of a series taken at a regatta on the Mersey, when the entrants were exceptionally favoured with a first-rate sailing breeze and bright sunshine.

The chief object I had in view, apart from my interest in the racing, was to make a fuller trial of panchromatic material. I used S.G. pan. with a 1½ times filter, gave a uniform exposure of 1/100th sec. at f/8, and developed subsequently with Rytol. A full bag of excellent negatives was secured.

Well away from a good start.

Photography of SUMMER FLOWERS

By BLANCHE HENREY.

The Emblem of Summer.

THE photography of flowers can prove a most fascinating subject for the amateur, and this is the ideal time of year to obtain the greatest number of varieties.

It is often difficult to take successful flower pictures in the garden owing to wind, unsuitable lighting or climatic conditions, but indoors with cut flowers plenty of time may be spent on arrangement, and long exposures may be given, as there is no fear of movement on the part of the subject, and either daylight or artificial lighting is at hand.

Cultivated flowers are easy to obtain, either from the garden or else for a few pence from a florist, and quite as beautiful pictures may be composed of wild flowers.

The flowers are best placed in a deep jar of warm water as soon as possible after they have been bought, or picked, and stood in a cold place for a few hours. They will thus have a long drink, and even the most delicate blossoms, such as the fragile-looking harebell, will, if thus treated, be less likely to wilt, and will remain in good condition and stand handling and photographing.

When they are being arranged simplicity should be the keynote, only sufficient blooms being used to make a pleasing composition, and focussing will be greatly facilitated if they are placed so as to be in a plane parallel with the lens. Some support is necessary to hold the stalks firmly, but this should of course not be shown in the picture. A large potato with holes is excellent for this purpose, and a jar filled with damp sand is also good. When, however, the subject grows with its flowers pointing downwards, as in the case of many flowering shrubs, its natural position may be retained by supporting the end of the branch on some slight erection so placed as not to figure in the negative.

A plain background is the most suitable. If the walls of the room are of some pale colour they will often provide all that is necessary, otherwise sheets of light or dark-coloured art paper make excellent backgrounds. The tone used must depend on the colour of

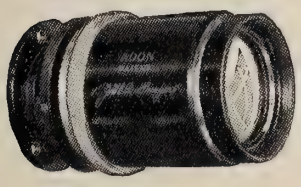
DALLMEYER LENSES

Only highly skilled craftsmen of many years experience are employed on precision work in the Dallmeyer Factory at Willesden, London.

BRITISH MADE AND BACKED BY 75 YEARS EXPERIENCE IN THE MANUFACTURE OF OPTICAL EQUIPMENT.



The name Dallmeyer is synonymous throughout the English-speaking world with lenses of the highest quality. Latest and finest precision machinery is employed for polishing lens surfaces to half a millionth of an inch accuracy. Exacting tests by highly trained optical scientists ensure that every lens maintains the high Dallmeyer standard before being issued. There is a Dallmeyer lens for every photographic and cine requirement.

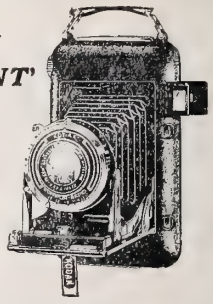
3¼×2¼ Superfekta, f/3.8 Zeiss Tessar anastigmat, delayed-action Compur shutter, speeds 1 to 1/250th sec., T. and B., complete in leather case. List £28 8s. 6d. £19 17 6

Typical WESTEX Value!

THE "WESTEX MINIATURE"

A most efficient high-precision camera at a marvellously low price. 16 pictures 4×3 cm. on standard V.P. spool. Splendid results, easy manipulation. Quick, self-erecting front, f/4.5 Vidanar anastigmat lens, focussing down to 3 ft., Vario shutter, 1/25th, 1/50th, 1/100th sec., T. and B. Direct-vision optical finder. Beautifully made, very compact, slips easily into your pocket.



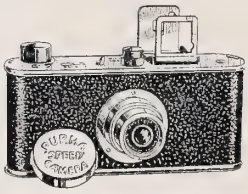
Price (as above)..... **£3:12:6**

Nine monthly payments of 8s. 7d.

With Radionar f/2.9 anastigmat and Prontor shutter, 1 to 1/175th sec., T. and B. **£5:12:6**

Nine monthly payments of 13/2.

NEW KODAK 'REGENT'

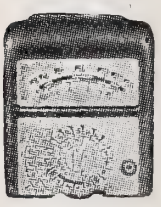


Takes 8 2¼×2¼ or 16 2¼×1¾ on normal film.

Latest modern stream-lined construction Self-contained range-finder, coupled with lens, f/4.5 Tessar and Compur Rapid shutter, 1 to 1/400th sec., delayed-action device, including leather case .. **£20:0:0**

Nine monthly payments of 46/8.

The 'PURMA' Speed —New Miniature all can afford . . . . . .



Very simple and efficient. Excellent results. Instantly ready on removing lens cover. Takes 16 pictures on standard V.P. film. Unique self-adjusting focal-plane shutter, giving 6 instantaneous speeds 1/25th to 1/200th sec. Compact and easy to carry.

35s. 0d.

COMPLETE.

'SIXTUS' Photo-Electric Exposure Meter for LEICA

Four times as sensitive as earlier models. Direct readings even in dark interiors. Most compact, with protective case securely fixed. Held by one finger. Measures only 2¼×2×1 in. Complete in case.

£5:5:0

Nine monthly payments of 12/3.

The REMARKABLE NEW ROLLEICORD

With its notable improvements the New Rolleicord becomes a real "Camera-de-Luxe," despite its economical price. Film wind is now automatic; overlapping of exposures impossible. New type hood and larger magnifier, and new ultra-efficient eye-level focussing arrangements. Focussing knob combines depth-of-focus indicator, and engraved exposure scales are provided. Both f/4.5 and f/3.5 models take all Rolleiflex accessories (angle mirror only excepted). Both models, too, are leather covered.

PRICES

Zeiss Triotar f/4.5 and Compur shutter to 1/300th sec., T. and B.

£14:10:0

Nine monthly payments of 33/10.

Zeiss Triotar f/3.5, ditto

£16:0:0

Nine monthly payments of 38/6.

Ever-ready case....£1

NEW ZEISS IKON CONTAX II

Exclusive Zeiss Ikon wedge-type distance meter now combined with view-finder. Shutter speed increased to 1/1,250th, all speeds always clearly visible, delayed-action release.

F/3.5 Tessar..... **£40:10:0**
Nine payments of 94/6.

F/2.8 Tessar..... **£43:5:0**
Nine payments of 100/9.

F/2 Sonnar..... **£50:10:0**
Nine payments of 117/10.

F/1.5 Sonnar..... **£65:15:0**
Nine payments of 153/5.

Newest introductions now in stock—at the Westminster

Continued from page 86.

the subject, but it is always best to obtain as much contrast as possible so that the flowers may stand out well in the picture.

Daylight or artificial light may be used, but the latter is apt to give rather harsh results, and delicacy of texture is easily lost.

Romneya Coulteri (Californian Tree Poppy).

The best illumination is when the subject is placed near a window, preferably one facing N. or N.E., and a little to one side of the direct light. Strong sunlight is never advisable, as it produces too sharp contrasts, but if some sheets of tissue paper are pinned over the window this difficulty is easily overcome.

Diffused light is essential when dealing with such subjects as white flowering shrubs, such as the Mexican orange blossom. In such cases the great contrast between the flowers and the very dark foliage must be reduced as much as possible.

A reflector is usually needed on the side opposite the source of light to soften the shadows, and a mirror or sheet of white blotting-paper may be held up during the exposure. With white flowers, such as the Californian tree poppy, the light must be studied with extra care, otherwise it is easy to obtain a very flat negative. For these flowers the light must not be too much diffused or the form and modelling of the pale and delicate petals is lost. A fairly strong lighting is often an advantage, as this will provide the darker shadows necessary.

Acroclinium (Everlasting Annual).

Campanula Rotundifolia (Harebells).

Although the best pictures are usually made with a field camera, excellent results can be obtained with any type. The amateur photographer with a small camera who possesses one of the portrait attachment lenses to slip over his ordinary lens, will find it a valuable adjunct when he wishes to be within six feet of the object to be taken.

A tripod or some sort of support is an essential, because a time exposure is nearly always necessary. The lens must be well stopped down, to f/16 at least, because then perfect sharpness can be assured throughout the picture. It is wise to give a rather full exposure, so as to record all detail, and as, with flowers, delicacy is more often wanted than brilliancy, the development time should not be too long.

Except in the case of red subjects, any orthochromatic plates or films may be used in conjunction with a pale yellow filter. But for perfect rendering of the colour values it is often best to employ panchromatic material with a darker yellow filter.

This is particularly necessary if a group of different coloured flowers are photographed.

PICTO
Inex

By D. E. ROUGEMONT.

A matter of balance.

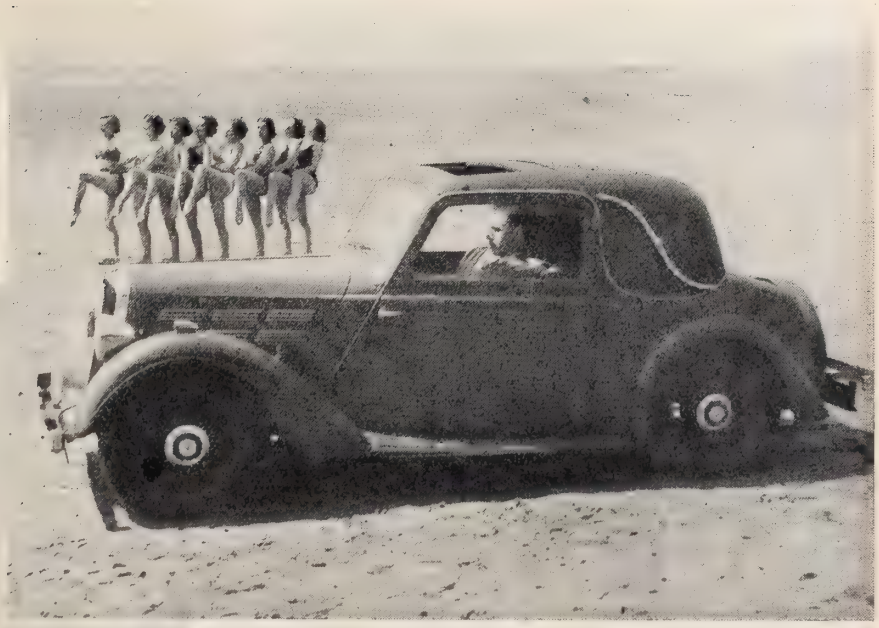
It is true that any ingenious photographer can produce distorted perspective with a wide-angle lens, and, with an infra-red plate and screen (or with an ordinary plate and no screen) he will play pranks with tone values, but to say the camera is a prevaricator on that account is akin to accusing the blood-stained hammer of murder.

That is, however, beside the point, and the point of the present article is to indicate to the amateur photographer a form of holiday snapshot that has the merit of novelty, and which, on occasion, can be amusing.

WHEN the yokel, on a certain historic occasion, was told that the moon was bigger than his cart-wheel he flatly disbelieved it. The camera, or, rather, the lens of the camera, has much the same outlook as that yokel—it has no imagination; it sees things exactly as they appear and on one plane. It does not reason; in short, it is one-eyed.

To the eye of the camera the cart-wheel at two yards distance is definitely bigger than the moon at 240,000 miles, and it will faithfully record that fact on the film or plate.

Mrs. Gulliver at play.



Through the hoop.

No better place to practise this work can be suggested than on the sands or beach at the seaside; in fact, to be rendered at its best, a flat open space is essential. It is also desirable that the lens should be of short focal length, and for that reason the modern miniature camera again demonstrates its remarkable capabilities.

It will be obvious from the illustrations that the intention is to deceive. The depth of focus of the lens has been taken advantage of to produce effects that only an awareness of

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

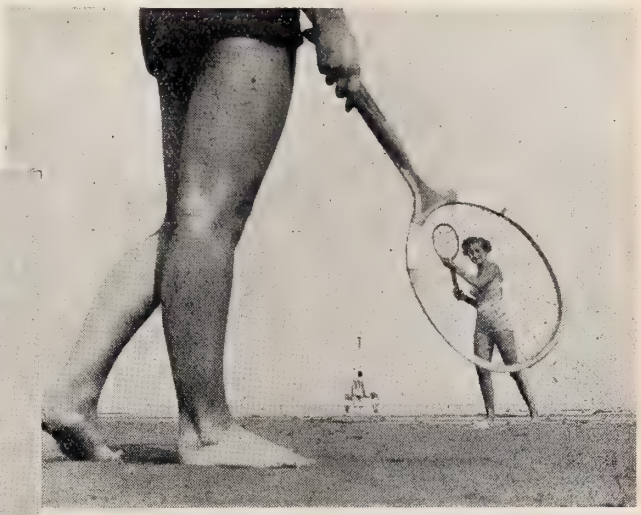
RIAL actitudes

Something like a mascot !

Wheel decoration.

the laws of perspective will tolerate after careful inspection.

To secure these results it is necessary that the near and distant planes of the photograph must be sharply defined at the same time, and that there is no middle distance worth mentioning. In most cases, too, a low viewpoint is essential to cut out the connecting link of the ground itself. By these means the nearest object at close quarters assumes an exaggerated proportion, while figures farther away are apparently on the same plane, but on a much smaller scale.



The only case shown here in which a higher viewpoint occurs is in the illustration of the motor car with the row of dancing girls on the bonnet, but here again the middle distance is hidden.

In working out ideas for photographs of this sort it is necessary, first, to decide on the relation of the subjects to each other in the different planes, and then to assure oneself that the finder of the camera is strictly accurate and free from parallax.

For instance, the motor-car picture, and the photograph called " A matter of balance," would lose their point if the position of the feet of the distant figures had been anywhere but exactly where the photograph shows them to be.

The croquet player's dream.

Extremes meet. Note the three bathers entering the sea.

The whole idea is a variation of " new-angle " photography, and, as such, offers endless possibilities for novel effects which, however, would be ordinary if considered stereoscopically. The camera cannot really lie, it is merely one-eyed, and the photographer is exploiting its little weakness.

Readers of " The A.P." should try their hands at making some " pictorial inexactitudes " at the seaside this holiday season. Anyway, they will be a change from the usual bathing snapshots.

Pictorial Analysis

Some Notes on the Art page Pictures reproduced in this issue.

THE happy and carefree spirit of holiday time is admirably epitomised in this fine impression of a laughing child. **"Seaside Joy," by K. Reitz,** is further characterised by an excellent feeling of sunshine; is instinct with the joy and life of the moment; and the gaiety of expression is not only

exceedingly attractive, but highly infectious in its engaging charm.

It is notable, too, in that, notwithstanding the fact that the model would be looking straight at the photographer, there is no suggestion of camera-consciousness. On the contrary, the rendering is remarkably spontaneous, a feature which lends it a greater than ordinary appeal.

As a composition, it is well designed, the head, acting as the centre of interest, being placed sufficiently off the centre to avoid symmetricality, yet far enough away from the margins to avoid any suspicion of weakness. It is efficiently isolated from the setting, the lights of the hair coming against a darker section of the background, and, elsewhere, a stronger tone in the features being contrasted with a somewhat lighter tone behind, the values being well defined, while, at the same time, the outlines are lost and found again in a most attractive fashion.

Considerable strength is given to the head by the pyramidal formation which the body and limbs assume. Reference to the dotted lines of the sketch will disclose the manner in which the formation is suggested, and it will be seen how the placing of the head at the apex—with the lines of both sides leading up to it—enforces its significance.

It is singularly well contrived, and another feature that enhances the daintiness and charm of the impression is the high key in which the subject is presented. It is highly appropriate, and no less suitable is the slightly darker general tone of **"Come on, Daddy!" by M. Hern,** where two figures, instead of one, are treated.

In spite of the fact that it is always more difficult to handle two figures than either one or three, the arrangement falls together very well, and the way in which the smaller of the two is made to attain supremacy is both remarkable and unusual. In ordinary circumstances, the greater mass and proximity of the adult would easily outweigh the attraction of the smaller figure of the child, but here the latter is undeniably the chief. In all probability the reason is to be found, first, in the powerful suggestion of action imparted by the pose of the child (1) in comparison with the static impression conveyed by assumed reluctance of the father (2) to enter the water, and, secondly, because of the placing of the child more "in" the picture.

The device is most effective, and, as in the example formerly discussed, a considerable measure of attraction owes its existence to the child's expression. It is no less vital and lively, and another feature that is worthy of notice—although a minor one—is the way

the water is rendered. Its gradations are very pleasing indeed, and the way the bits of foam curve round in the immediate foreground is highly intriguing.

The holiday feeling, again, finds full expression, and, technically, the standard achieved is excellent and well worthy of study and emulation.

"The Summer Girl," by Frances, strikes a more sophisticated note, but these two qualities are repeated, and are equally in evidence. The impression, perhaps, is scarcely characterised by the same sense of spontaneity, for the model, quite openly, is aware of being photographed and fully enjoying the experience.

But she is not camera-conscious in the sense that she has been made self-conscious by the presence of the camera, which is rightly regarded as an undesirable feature. Rather does she seem to be frankly interested, not so much in the camera, but in the operator, and, in viewing the picture, this interest passes to the beholder. The fact seems to create an intimate and charming sympathy at sight, and is an impression to be cultivated rather than disparaged.

Concerning the composition, it will doubtless be observed that the figure is placed almost precisely upon the vertical centre line. Such an arrangement does approach symmetricality, but, with a single figure, this is permissible, and, indeed, is as forcible as could possibly be contrived. Absolute equivalence, however, is prevented by the way the figure is posed, the arm on the left-hand side of the picture being at a different angle from the one on the other side, and the body itself is inclined more to the left than the right. Moreover, the right-hand side is appreciably nearer than the left.

These differences may be slight, but they are sufficient to enable the drawbacks of formality and rigidity to be escaped, while, otherwise, the power and virility of the arrangement provides its own justification.

Furthermore, the slope of the foreground lines affords a counter relief, and a similar aid comes from the disposition of the pair of handrails.

It may be, perhaps, that the height of the viewpoint tends to dwarf the figure slightly, but it is difficult to see how this could be avoided, particularly as the stance seems to have been deliberately chosen with the idea of keeping the water as a setting, probably on account of the possibility of the intervention of undesirable intrusions likely to arise with any alteration.

A shot "into the blue" forms the subject content of **"Three Gulls," by Helen L. Barham.** It is a fine example of high-speed work; of rapidity in action; and in the exact choice of the psychological moment for making the exposure. Its delicacy of key is

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

EVERYONE, nowadays, is talking either about the holiday they have had, what they are to do during the holiday they are enjoying, or where they are to go when their holiday time arrives, and, whether they seek a place where "The music goes round and round," as typified in No. 1 of the prints reproduced on the opposite page, or prefer the peace and quietude depicted in No. 2, photography is an almost indispensable adjunct, and, if it does no more, is able to recall the happy memories and enlivening atmosphere of the holiday when it has passed.

Holiday Time and the Camera.

That it *can* achieve a much higher level is undeniable, and convincingly demonstrated by the pictures shown from time to time on our centre pages and by the various exhibitions which are held both in London and in the provinces.

Many there are who employ their holiday in the securing of subjects for working up at a later date into exhibition prints; others make use of photography to illustrate hobbies of another type in which they may be interested, and of which nature study, archæology, ornithology, or geology form examples; but the great majority use the camera simply to produce records of people, scenes and incidents which they come across during the holiday period.

It is a wise precaution, whether the aim be pictorial, scientific, or record making, to give the camera a sort of preliminary canter or a test before the holiday actually commences. The exposure of a roll of film or half a dozen plates, as the case may be, may be the means of enabling defects to be corrected, and of preventing the spoiling of a whole series of what may be irreplaceable subjects; or, if it only reveals the fact that everything is in order, it is a very satisfying assurance, and, in any case, familiarises the manipulation of the instrument anew.

Choice of Subject.

Moreover, if the subsequent operations of development and printing are carried out at home, it gives a lead that should prove exceedingly useful when the holiday exposures come to be treated. And it has been known for such an experimental excursion to provide an unexpectedly satisfying picture!

However, to return to No. 1, "A Song by the Way," by G. P. Goddard, this makes quite an interesting example of a holiday record. The photography is good; there are no technical failings of any moment; and the likeness of the subject seems to be faithfully rendered. The features of the model, perhaps, are a little heavy in tone, and another impression, in which printing is not carried quite so far, would, in all probability, be more acceptable.

The fact that the sky forms the setting is inclined to exaggerate the weight of tone in the face; but that it is possible to obtain better values is shown by No. 2, "A Moment for Meditation," by A. McLachlan, where not only are the features clearly to be seen, but there is also a better rendering of the tone of the sky.

Judgment and Technique.

From the technical standpoint the work is excellent, and, in placing the figure and in the arrangement of the setting, a considered judgment seems to have been exercised.

It may be that the figure would seem more suitably posed if her body and legs were shown in a three-quarter view, the legs being extended towards the left rather than broadside on, but, as it stands, the work is as successful as any on the page, and, in its class, is very good indeed.

No. 6, "Fishing," by Captain J. Joyne, runs it very close, for its grouping, notwithstanding the number of figures, falls together very well; the relative tones of sunlit garments and sky are attractively represented, and there is a fine feeling of luminosity. A lesser number of figures, no doubt, would have made up more satisfactorily, but, if such an arrangement had been waited for, either the effect might have passed or the desired grouping might never have transpired. It is always wise to make sure of a subject like this as soon as it is seen, and, once that is done, to hang around for a bit to see if anything better turns up, taking full advantage of any opportunity that may arise.

No. 3, "Branscombe Smithy," by A. J. Potten, scarcely reaches the same standard. In fact, it is a bad example of a negative that has been considerably over-developed having regard to the contrast range of the paper on which it is printed, about which we talked at length last week.

Exposure and Development.

Reference back will indicate the appropriate treatment—the substitution of a softer type of printing paper—and the reason for it; but such an excess of contrast seems wrong in itself, and it is rather a wonder that the cause was not sought and the fault corrected before submission.

There is a similar suggestion, also, about No. 7, "Contrasts—Cascais, Portugal," by Luis de Cawalha, though in this instance the defect appears to be complicated by a measure of under-exposure. The excess of contrast can, of course, be remedied by the same expedient, but nothing can be done for the lack of gradation arising from an inadequate exposure.

Had an experimental excursion been made beforehand on the lines previously indicated, and had a similar result been obtained, it should have enabled the faults to be guarded against, if not entirely eliminated. There is, however, always the possibility of an abnormal subject turning up, as would appear to be the case with No. 5, "Interior," by Miss M. Seddon, where the subject contrasts would much exceed the average, and where special steps would have to be taken to counteract it.

The Abnormal Subject.

The proper way to handle such a subject is to reduce the time of development of the negative, and, if necessary, further limit the contrasts by employing a softer type of paper than usual; but, only too often, the nature of the subject is not fully appreciated, or it does not happen to be possible to treat it in this way because it occurs on a roll of film with others that do not need any departure from the normal.

The only alternative, then, is to rely on finding a printing paper that is sufficiently soft, but this, of course, is throwing too much on the paper and may not always be successful.

"MENTOR."

Making the Camera

A passenger in his own car with himself at the wheel.

THE making of photographic "doubles" is, of course, an old idea, and has been described in "The A.P." in the past. By "doubles" is meant the inclusion of the same person or persons in two different positions in the same photograph.

It is not generally realised, however, that it is a method that can be easily and quickly accomplished by the keen amateur with any ordinary camera, although the larger the aperture of the lens the better for most subjects.

Personally, I have found the reflex camera of the twin-lens type the best for the job, and most of the illustrations herewith have been done with a Rolleiflex, which is easy to manipulate, and, with its large view-finder, enables the subject matter to be arranged quickly and accurately.

It can, however, be done quite successfully with the aid of the small view-finder on any ordinary camera, or, if desired, a separate larger view-finder can be fixed and used.

The actual accessory for making the double exposures is a simple one, and is as follows:

Morning greetings to yourself.

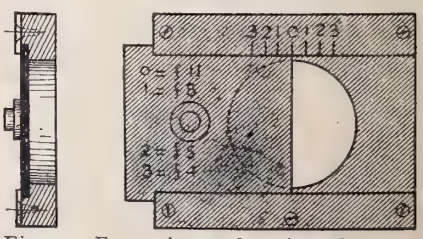
Make a cap to fit the lens, and cut out less than half as shown in Fig. 1. The top of a small tin or shaving-soap container or something similar can be made use of for the purpose.

It should not be a tight fit, but be capable of being turned easily on the lens without shaking the camera. The camera should be placed rigidly on a stand if perfect continuity of background is required.

The subject is arranged and an exposure made with the shutter, but with the cap on the front of the lens to expose one half only. The cap is then revolved to the opposite position and another similar exposure made with the shutter after the subject has moved over to the other side of the picture space. A few experiments at different apertures will indicate the one that gives the best results without any line of division whatever. Once this is found the cap is marked for future reference.

I have three caps in use for f/5.6, f/8 and f/11, to get various depths of

Fig. 1.—Showing the cap with section cut out for taking doubles.



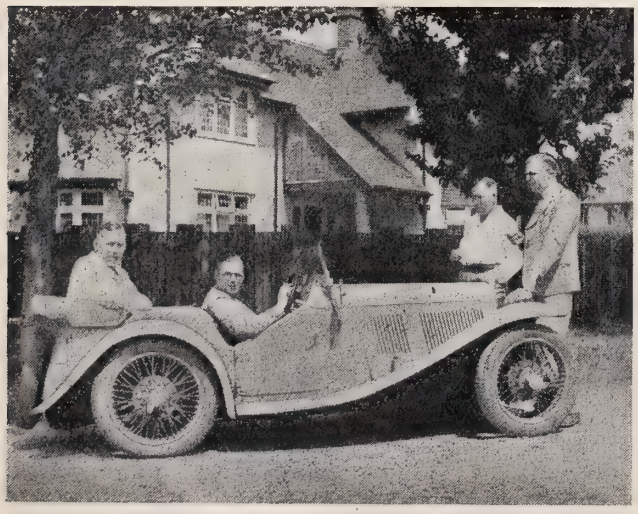


Fig. 2.—Front view and section of fitment with sliding mask for adjustable openings.

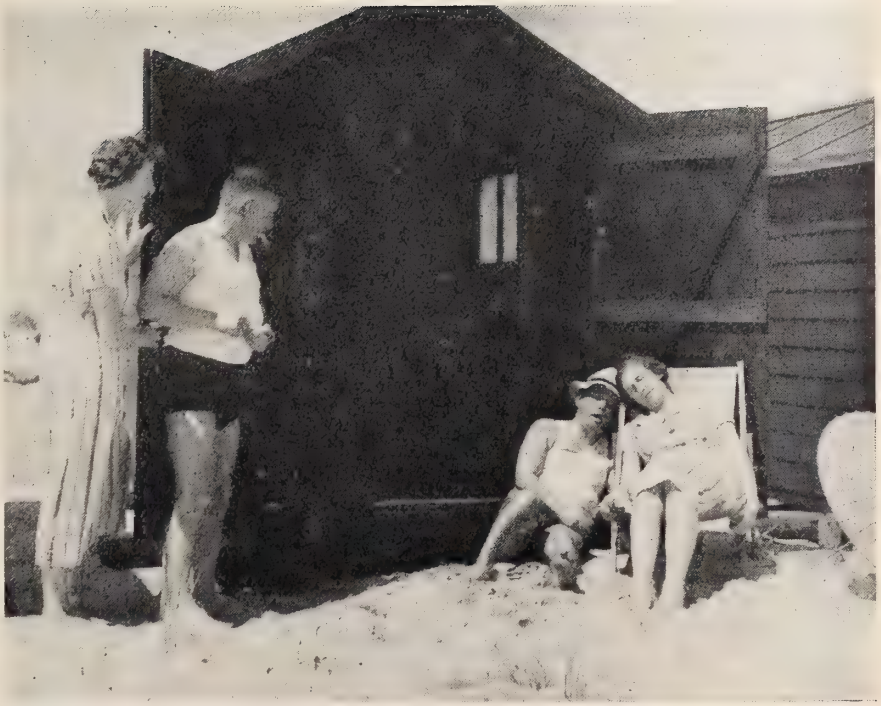
The same couple in the car and looking on.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

See Double



By W. WATSON WRIGHT.

focus, and the cut-out portion varies according to the aperture used. The smaller the stop the nearer the division must be to the centre of the lens. With a large stop nearly the whole of the front of the lens is covered.

Cameras with focussing screen backs will be very useful for this work, but once the experiments are over and notes have been made a reliable "finder" will be quite sufficient guide for making good "doubles" as easily as ordinary photographs.

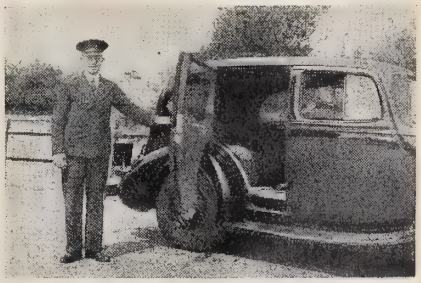
All the "doubles" shown here have been made by this method, and even more elaborate groups can be attempted.

If necessary the attachment shown in Fig. 2 can be readily made. This

Catching yourself napping.

Fido does not like himself.

is attached to the lens and has a shutter or mask sliding in grooves. It is pushed to the right for one half of the exposure, and then to the left for the other half; the various positions and data for reference are marked on it. It can be fitted to the lens direct, and here again it will be noted that the smaller the aperture of the lens the nearer the middle the division must be. When a very large aperture is used in the lens the mask can be extended almost to the edge of the lens, and this will allow the two halves of the picture to vignette perfectly.



A few experiments will speedily decide exactly how far the mask should cover the front of the lens for any particular stop. The exposures also will be found by experiment, but as a rough guide it may be taken that each half of the picture will require nearly double the correct exposure for the entire subject if the lens were not shielded.

I feel that the lens cap, which can be so easily turned, is a simpler accessory for this work. It can be used for taking two separate pictures on one negative, horizontal or vertical, with camera in hands, and cheapen photography at will. No masking of negative required, and, if necessary, the whole negative can be exposed if desired. At present some cameras mask the film for sixteen exposures; but, once this is fitted, you have to carry on at that size.

It may interest readers that, if required, and if suitable subjects could be found, I can get twenty-four pictures on the standard eight-exposure spool. Any division can be masked off when enlarging and two separate pictures made. With a little care and ingenuity the "doubles" can be multiplied into "trebles" or even "quadruples"!

A family of three.

The chauffeur-footman.

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

SUMMER SUNLIGHT AND SHADOW.

HARDLY any rational human being can look through one of the old "family albums" without mixed feelings of amusement and boredom. The amusement is easily accounted for; although I am doubtful myself whether crinolines, whiskers and aspidistras should not come into the category of tragedy rather than comedy. But I am not sure that one of the chief causes of the boredom is recognised; that is, the dull and monotonous character of the lighting. The common and even the spotted portrait artist of the period, under his attic skylight, was more likely to bear the name of Mumblechook than of Rembrandt. His handicap was heavy, and in more senses than one he worked according to his lights.

But look at the best studio work of to-day; and look, too, at the "commercial" photographs, including still life, in modern advertisements; and you will see what miracles of beauty and dramatic effect can be worked by skilful lighting.

A similar change for the better is noticeable in ordinary outdoor photography—the sort of thing most of us are constantly doing. The main aim of the early outdoor photographer was definition. He aimed at showing every brick in the wall, every leaf on the tree, and the time by the distant clock. To achieve this he was not above stopping down to f/64, an aperture which most modern photographers have never even seen.

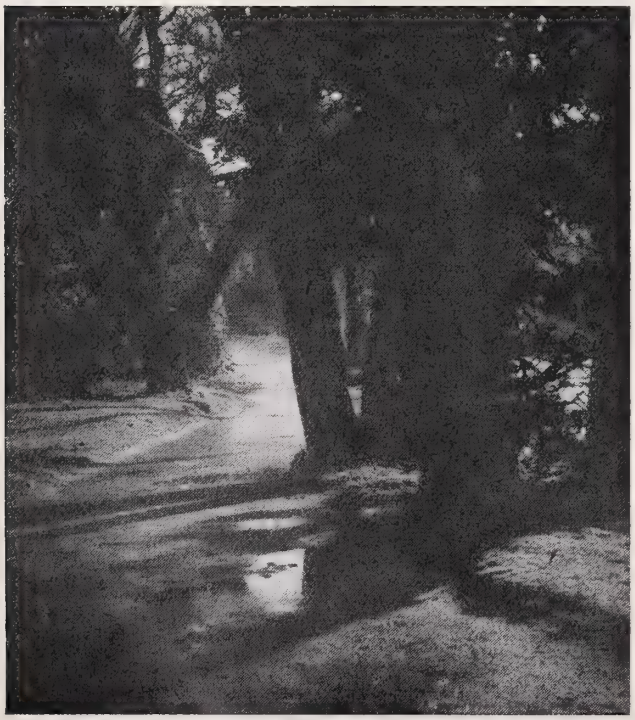
Such an old-timer seldom troubled himself with "effects," and even if he had recognised them would have been hard put to it to do them justice with the means at his disposal. Now, some of the finest outdoor subjects depend for their attraction mainly, or even entirely, on sunlight and shadow. It is true that the sun is not as amenable as the flood-lamp and the spot-light, but when he is in the mood, and in good form, he can do more wonderful things than either.

Wherefore, it is a pity that so many beginners make a mess of the job when they get a good sunlight and shadow effect offered them. What makes it the more pitiable is that there is no earthly reason why they should. There are two reasons for their failure: the first is that they do not see correctly what are the real characteristics of the effect; and the second is that they do not understand the technical procedure necessary to record it.

The four illustrations, by different workers, will help us to get an idea of how we can go wrong.

To all those with knowledge of natural effects, that shown in Fig. 1 will at once proclaim itself as false. It is not true to nature. Although taken when the sun was shining and casting shadows it does not reproduce the effect. It is nearer the effect of bright moonlight, but it is not true to that either. We can only think of the light that never was on sea or land.

At a glance Fig. 2 is more convincing. There are marked contrasts of light and shade, but they are properly balanced. A comparison of these two will take us direct



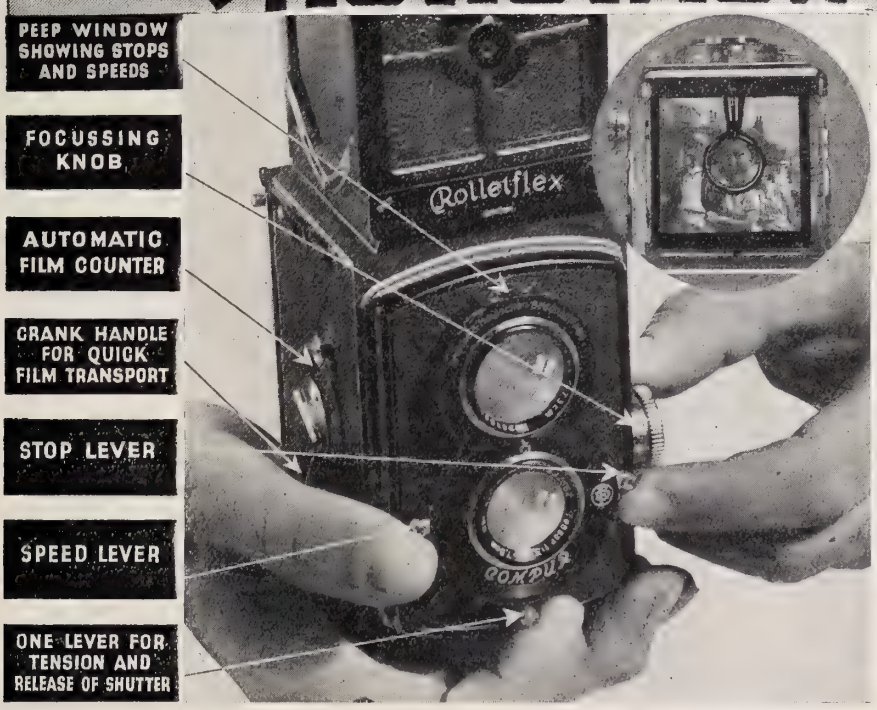


Fig. 1.

Fig. 2.

THESE Rolleiflex

SPECIAL FEATURES BRING PERFECT PICTURES TO YOUR FINGERTIPS

You won't find a more easily manipulated camera than the Rolleiflex—that is why it is eminently suitable for holiday photography. It enables you to get absolutely first-class pictures without a lot of bother. For instance, look at the convenient arrangement of controls, notice how you can see your picture and adjust your stop and speed at the same time. Notice the focussing magnifier which gives you hair-sharp pictures in a split second.

No other camera using roll film offers such versatile service as Rolleiflex. It is designed for use with numerous Rolleiflex accessories, which make it suitable to cover the widest range of photographic requirements. It takes twelve pictures on $3\frac{1}{4} \times 2\frac{1}{4}$ 8-exposure roll film. The square format makes an instant appeal for the convenience it offers in being trimmed or enlarged to any desired shape. Rolleiflex is fitted with Compur shutter, speeded up to 1/500th sec., T. and B., and f/3.5 Zeiss Tessar lens **£25**

The Rolleiflex is a great competition prize winner. The picture on the left, which can be seen on the hoardings in all parts of the Country, was taken with a Rolleiflex, and won £2,500 for its owner; awarded by the *Daily Herald* last year. Numerous other prizes have been won by Rolleiflex.

to the root of the matter; which is, that to get a realistic result we must have the appropriate details and gradations in both the lights and the shadows. This can be secured—not always easily—by a close approximation to "correct" exposure and development. The two are inseparable.

It was as an aid to this that such sayings were invented as, "Take care of the shadows and the high-lights will take care of themselves." (The financial version of this is used as a justification for stinginess.) Another version is nearer the mark, "Expose for the shadows, and develop for the high-lights." This is the only practical solution of the matter. We must give sufficient exposure to enable the appropriate shadow detail to develop out at the proper time, and stop development before the high-lights become over-dense and "clogged up."

The exposure for Fig. 1 was too short to register detail in the shadowed tree trunks; in Fig. 2 it was sufficient to do so.

The title of Fig. 3 is "Sunny Spain," but not even in Spain on a sunny day would there appear large areas of inky blackness. Even the cast shadows are solid black. The negative was under-exposed, although the exposure was sufficient for the sky and the brighter parts of the landscape. But the parts in shadow are quite as important.

Fig. 4 is more suggestive of sunniness; the exposure was quite as full as was necessary; but development was apparently a little overdone. It is, of course, wrong to over-expose and over-develop, for we shall obviously lose the depth and richness of the shadows.

In some countries the contrasts of light and shade are greater than anything to which we are accustomed, but it is found that even then the "soot and whitewash" effect is useless. It needs slight modulations both in sunlight and shadow.

You might think out this point. Suppose the sun "goes in" for a bit. Look at what were the heavy shadows while the sun shone. They seem full of detail. Now the sun comes out. Does this cause there to be *less* light in the shadows? If so, why? W. L. F. W.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Using a Filter.

I am not satisfied when I take a photograph with blue sky and light clouds; the sky is always too weak in the print. I use roll film; should I get panchromatic? Also would a sky filter help me? *J. T. T. (Monmouth.)*

For the purpose you have in view there is no need for you to change over to panchromatic film. We advise you to stick to whatever film you are accustomed to, as it will record the blue sky properly if you go the right way to work.

A sky filter is very helpful in certain cases, provided it is properly adjusted to the lens; but we would advise you to get a plain yellow filter that will fit on the lens like a cap, or clip on to the mount with springs. It should be sufficiently deep in colour to make it necessary to give about double the exposure that would be right without it. This you can manage by using the next larger stop (e.g., f/8 instead of f/11) or the next slower shutter speed (e.g., 1/25th instead of 1/50th. If you do not give the necessary exposure for the filter used you will under-expose.

The effect of such a filter is to cut out some of the blue rays, so that the blue sky will not be so dense in the negative, and will therefore give a darker tone in the print. At the same time, the yellowish clouds will be strong in the negative, and brighter in the print. You will probably be surprised at the improvement resulting from such simple means.

Middle-day Exposures.

What is the reason for saying the middle of the day is the worst time for photographing? Is not the light at its best then? *A. A. (Scarborough.)*

Although the light may be at its strongest around midday, a strong light is not the only consideration. Shadows are more restricted, and contrasts are stronger, and softer lighting and longer shadows are often an advantage. At the same time the statement as you quote it is too drastic and sweeping. Middle-day is often quite a good time for photography. You must look out for the best effects of light and shade irrespective of the time of day.

How I make my EXHIBITION PICTURES

No. CCCXLIII.

Methods and Ideals of well-known Pictorial Workers.

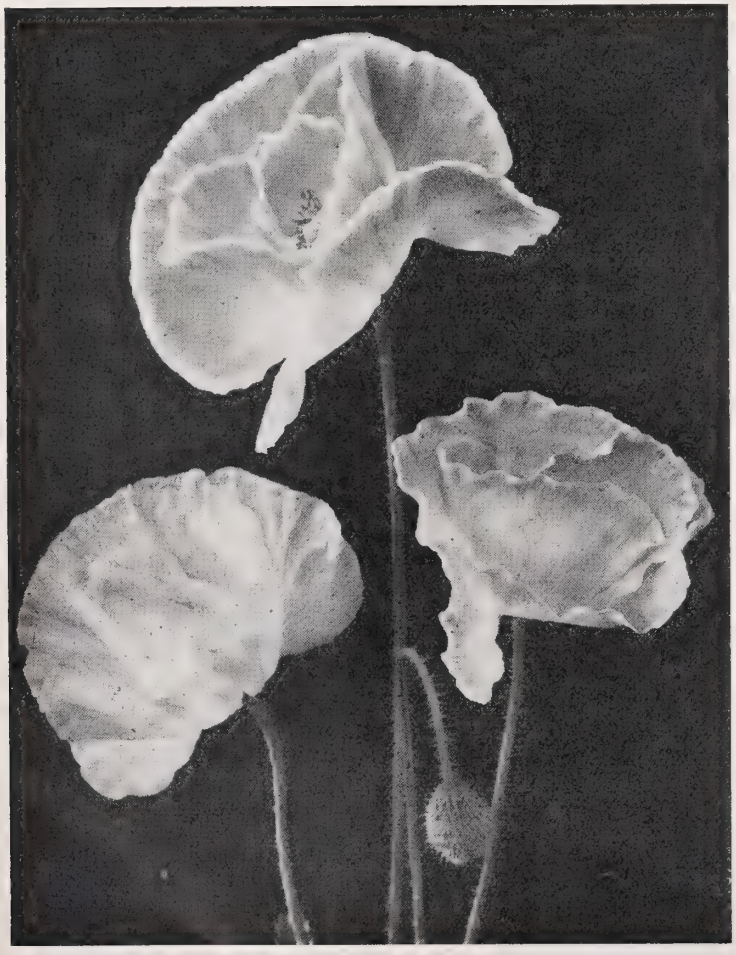
Miss BLANCHE HENREY.

From information communicated to our Special Representative.

"MY first interest in photography was aroused by the gift of a $3\frac{1}{4} \times 2\frac{1}{4}$ folding Kodak and a copy of *The Amateur Photographer*. After reading the latter I became so enthusiastic that a few months later I took a course of photography at the Regent Street Polytechnic, where I spent two years engrossed in all the mysteries of negative and print making.

"Although more or less interested in all branches of photography I now specialise almost entirely in flower and garden subjects, finding that this is such a wide field by itself that there is little time to explore others.

"With every negative of cut flowers I spend considerable time beforehand in their arrangement, studying the effect on the focussing screen, and striving to get a feeling of balance and completeness. Simplicity is always my keynote, and my aim is to show the particular subject to the best possible advantage. Not only is the arrangement important, but lighting plays a vital part in the modelling and the reproduction of a beautiful texture.



"I make no special negatives for exhibition work, but select from my stock a few that I consider will make the best prints for hanging on the walls—generally those of fairly large subjects, and of the most attractive flowers.

"I do very little after-work on the negatives, although there are often small blemishes on the leaves and flowers that need attention. Much retouching, however, is impossible on such delicate textures, and so I never attempt to photograph any flowers that are not absolutely fresh and in the best condition.

"The camera I most generally use is a Sanderson field model, with which I carry several lenses of varying focal lengths. The negatives are fully exposed, and afterwards developed so as to avoid any over-strong contrasts.

"When enlarging I like to make as large a reproduction as possible, but never one exceeding the natural size of the flowers; otherwise I think the result is unpleasant. As in the case of most other branches of photography it is often necessary to shade different parts of the subject during enlargement. Except for the touching-up of small blemishes, however, I do no finishing on the print, as I find no necessity for doing anything of the sort.

"I think that the great thing in all flower photography is to obtain such a true reproduction of nature that any one studying the picture will find himself brought into touch, as it were, with the living plant and its own natural beauty."

SHIRLEY POPPY. *Blanche Henrey.*

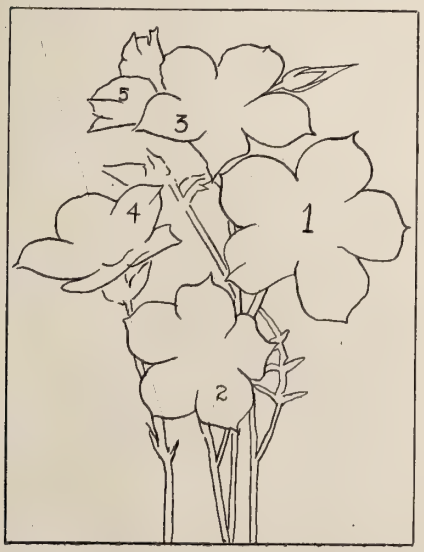
(*A further example of Miss Henrey's work is reproduced on the opposite page. See also article on pages* 86 *and* 87.)

BARTONIA AUREA.

By Blanche Henrey.

(See article, "How I make my Exhibition Pictures," also article on Flower Photography.)

THE MILL, FLAT DYKE.



(From the Advanced Workers' Competition. See article on Windmill Photography.)

By Arthur G. Dell.

Pictorial Analysis (*continued from page 90*).

delightful and something of an achievement in the circumstances, while the feeling of sunlight on the plumage of the birds is admirably displayed.

The impression of action, too, is vivid and arresting, and noteworthy, also, is the recurrence of the pyramidal formation suggested by the way the birds are placed. The topmost bird (1) by virtue of its placing and position at the apex, assumes pre-eminence and becomes the centre of interest, while the other two,

occurring on the edges, attract less attention and fall naturally into subordinate places. All the same, it does seem something of a pity that it was found necessary to cut off part of their figures, for, providing nothing else made an appearance, there would be a greater feeling of finish and completeness, and, as far as arrangement is concerned, nothing would be lost if the truncation had been avoided.

However, it is quite likely that the existing trim was dictated by what would have been an unfortunate intrusion, and, if this were the case, there is no alternative.

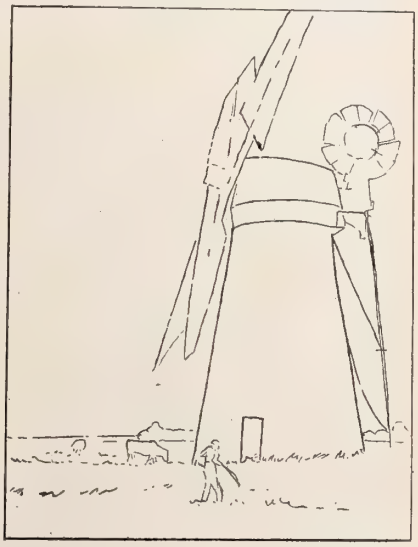
"Harvester," by S. D. Jouhar, takes us from the seaside to the country, but the subject, nevertheless, is equally typical of summer-time and the season of holidays.

A heavier key has been chosen for the presentment, the scale of tones ranging from blacks of high intensity to lights of quite considerable brilliance. Not only is the impression that is conveyed very rich and full of quality, but it is eminently suitable for the subject. With only the one figure, and that well isolated, the interest is unified and the arrangement does not offer any occasion for adverse criticism.

It is very well managed, and, here again, the model shows that she is well aware of being the subject of a photograph, and, apparently, quite approves the operation. At all events, she does not exhibit camera-consciousness in its unpleasing form, and her expression is agreeable and attractive.

A certain interest, too, attaches to the choice of setting. The perspective lines of the furrows, with their repetition, create a feeling of design, which, while by no means interfering with or overshadowing the figure, lends a measure of a decorative intention that, in a subordinate capacity, enhances the sense of order in the composition. It is a good feature, and the effect of sunshine, if not of any great moment, confers an impression of vivacity and brilliance that adds to the pictorial content.

An exceedingly fine still-life is provided by **Blanche Henrey** in **"Bartonia Aurea,"** in which the wax-like quality and delicate texture of the petals of the flowers is remarkably well recorded. This, and the subtlety of the gradations in the lighter tones, afford evidence of an extremely high technical standard, and, in the arrangement, an equally high level is achieved.



The full-faced flower on the right (1) is the chief and assumes principality on account of its superior mass and force of position. The one underneath (2) comes next in significance, and the remainder fall into the order indicated by the numbering in the sketch, the whole being very pleasingly designed. The dark tone of the setting shows up the brightness of the flowers to perfection, and, as to how it has been done, the reader is referred to the artist's own story on another page.

A summer landscape of the pastoral type is to be seen in **"The Mill, Flat Dyke," by Arthur G. Dell,** which, in its feeling of sunshine and of air and space, achieves a high measure of success.

The sunlight on the figure, on the fields in the middle distance, and on the top and sails of the mill, is shown in its true brilliance, and the glow of the latter against the darker sky has all the elements of beauty. It is to be regretted, however, that the author has seen fit to introduce a measure of diffusion, for it does nothing beyond confusing the outlines and introducing a feeling of indecision that the picture would be better without. If the figure and mill, at all events, were sharply defined, the work would be much more decisive and its attraction would be correspondingly enhanced.

It would exhibit a surety of touch that it now lacks, and the present suggestion of fumbling about for an effect, instead of boldly stating it, would be entirely removed.

On the other hand, its simplicity of arrangement is an excellent feature. The figure is well placed and

admirably leads up to and enforces the principality of the mill as the centre of interest. The cows are well employed as supporting accents, and the placing of the horizon—well down in the picture space—follows the best traditions of landscape composition.

All of this is excellently contrived and the effect is one of no little beauty and distinction. That so much that is good should be marred by the mistaken introduction of diffusion is all the more to be deplored, and it is hoped it will be found possible to substitute a more decisive rendering.

"MENTOR."

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, July 22nd.

Armley and Wortley P.S. Roundhay. Tram Stop, Canal Gardens, 7.15 p.m.
Borough Polytechnic P.S. Alliance Competition Prints, 1935.
Bristol P.S. Saltford.
Leigh L.S.P.S. Winwick (Bus 6.30, Spinning Jenny Street).

Thursday, July 23rd.

Bedford C.C. Millbrook.
Camberwell C.C. Open-Air Meeting: Ruskin Park. F. C. R. Herdson.
Hammersmith H.H.P.S. "Unity in Design." Henry J. Haley.
N. Middlesex P.S. "Are We Progressing?" Discussion.
Nottingham and Notts P.S. Thurgarton Priory. Leader: J. Cooper Sands.
Oldham P.S. Competition: Prints descriptive of Oldham.
Rochdale P.S. Entries for Exhibition Prints.

Friday, July 24th.

Sheffield P.S. Malin Bridge, 7.30 Rivelin. Leader: Mr. Gibson.

Saturday, July 25th.

Beckenham P.S. Colley Hill.
Bolton C.C. Ribchester (Trinity St. Station, 2 p.m.).
Bournemouth C.C. Poole Harbour by boat. Meet Quay, 3 p.m.
Bradford P.S. Knaresborough. 1.55 p.m. bus to Harrogate.
Bristol P.S. Compton Martin. (Affiliated Outing.)

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Summer-time with the Ciné Camera

By SIGURD MOIR.

THIS Special Summer Number of *The Amateur Photographer* would hardly be complete without some reference to the joys and tribulations of amateur cinematographers working during the present time of the year.

The joys, of course, far outweigh the other things—since the present time is ideal for shooting outdoor material; but little difficulties, nevertheless, do crop up, and it behoves every enthusiast to know how to deal with them.

Practical Work.

Let us touch first of all upon the material itself. It is advisable always to take away sufficient film to accommodate all the shots that are in project.

By the seaside, at high altitudes and nearly everywhere else when the sunlight is diffused by light cloud, exposure readings must be very carefully made. It is practically impossible for the stranger working under these conditions to avoid frequent under-estimations without such care, and in all cases the assistance of a reliable meter is indicated.

The modern photo-electric instruments are thoroughly trustworthy; though the converse *over*-estimation is likely to result unless the instrument is employed properly shielded or inclined *slightly* downwards to a point just below the centre of the set or subject.

Certain filters, too, are extremely helpful. Cinematographers working during the summer months may for the greater part of each day use a pale or medium green filter, whilst those who appreciate the heavier renderings of sky portions may use instead any yellow screen of moderate depth.

The proper use of amber and red filters requires some expert knowledge of camera work—and readers who doubt their ability in this connection will be well advised to attempt some preliminary practice on other and lesser films.

Filmic Material.

Most subjects in which there is any amount of appreciable movement may be classified as filmic. In summer subjects, too, there is usually a great deal of this movement; but there are also periods when hardly a bird stirs, when hardly a leaf is moving.

The inclusion of such periods in any film can definitely slow down if not altogether ruin the production, though (fortunately) we are able to supplant the missing action with considered movements of the camera itself—as was so commendably done by Arabella Hayne in the L.C.S. film "En Fête," and by George N. Booth in the Bolton Society's earlier production, "Saturday."

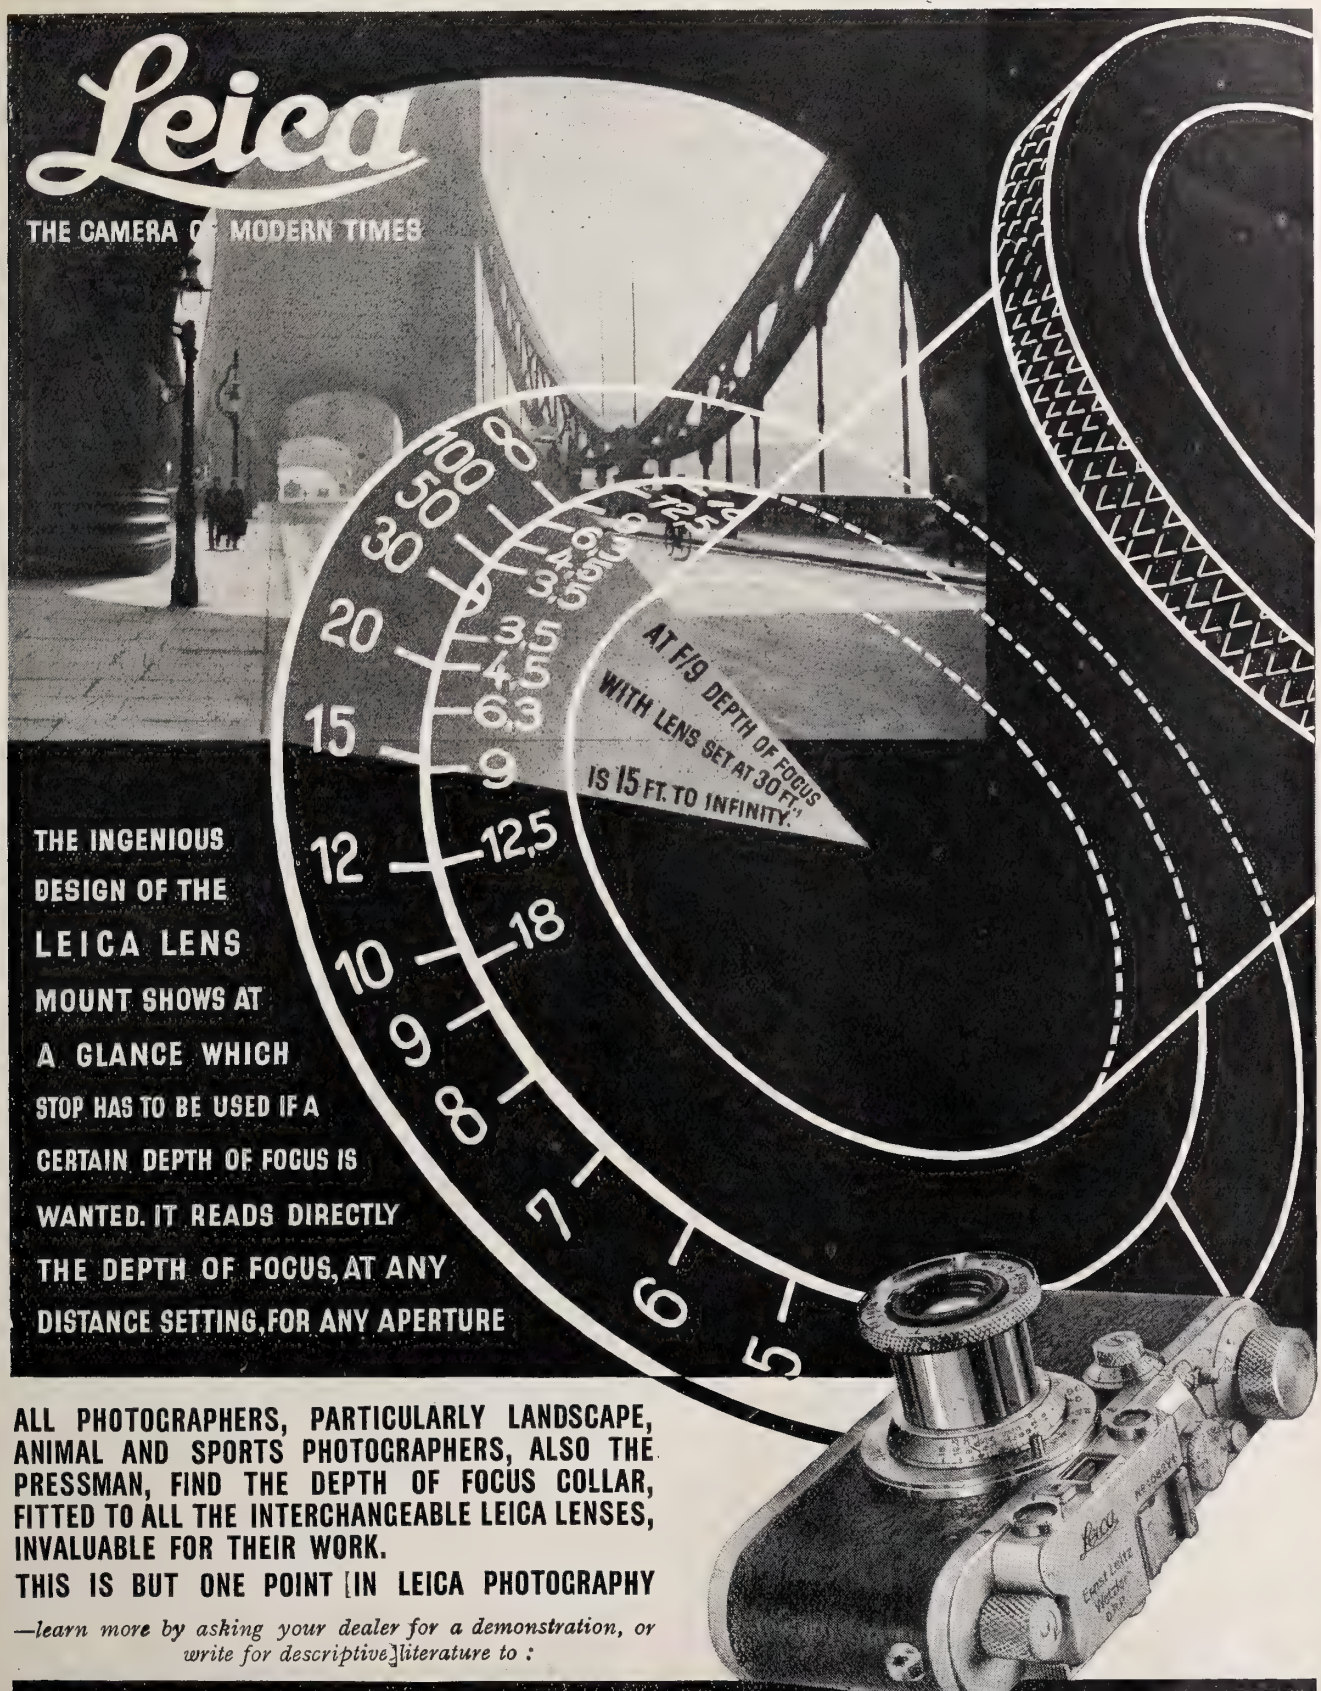
In moving the camera, care should be taken to prevent wobble or jerkiness which will subsequently affect the screened image. To this end, all tracking or following shots must be obtained whilst the camera is securely mounted upon a wheeled "dolly" which, in turn, should be moved only about a perfectly even surface.

For taking slow panoram shots, a tripod equipped with a firm, friction-grip head may be regarded as a virtual necessity. Swinging shots also require the use of a tripod; though, in this case, the head screw should be relaxed and the panning arm made to move with easy freedom.

Other Details.

Other details, lesser in the sense that they are not so technically interesting—but equally important when we consider the effect they have upon results—remain to be observed. Of these, certain features unavoidably associated with the powerful, direct rays of sunlight are probably the most troublesome. Such rays should in every case be avoided when loading and unloading the camera, whilst the influence of continued exposure at other times is deleterious to open lenses and perfectly ruinous to fine leather coverings.

Dust also is apt to prove annoying when filming in the open air, so much so that the camera should always be wiped out immediately before loading—and the cover returned as quickly as possible afterwards. Particular care must be taken to keep grains of sand and grit away from the camera gate, and also to keep lenses, filters, etc., free from dust.



Sea-water spray is slightly less troublesome, in so far as it may be more easily kept out of the camera. Nevertheless, it has an annoying tendency to form in diffuse manner on the outer surfaces of lenses and filters. This, of course, can be avoided by working away from the sea front; although, in cases where such a remedy is not practicable, the offending spray can be removed with a lens cleaner or with a piece of fine cambric.

Good action subjects of personal interest can be obtained at the present time at the seaside piers, especially those from which steamer excursions are run.

Leica

THE CAMERA OF MODERN TIMES

THE INGENIOUS DESIGN OF THE LEICA LENS MOUNT SHOWS AT A GLANCE WHICH STOP HAS TO BE USED IF A CERTAIN DEPTH OF FOCUS IS WANTED. IT READS DIRECTLY THE DEPTH OF FOCUS, AT ANY DISTANCE SETTING, FOR ANY APERTURE

ALL PHOTOGRAPHERS, PARTICULARLY LANDSCAPE, ANIMAL AND SPORTS PHOTOGRAPHERS, ALSO THE PRESSMAN, FIND THE DEPTH OF FOCUS COLLAR, FITTED TO ALL THE INTERCHANGEABLE LEICA LENSES, INVALUABLE FOR THEIR WORK.

THIS IS BUT ONE POINT IN LEICA PHOTOGRAPHY

E. LEITZ (LONDON), 20, MORTIMER STREET, LONDON, W.1.

"Shot" on "NURSERY ISLAND"

Unretouched "stills" from the film, by courtesy of Messrs. Gaumont - British Instructional, Ltd.

"Excellence of exposure due entirely to your 'AVO' Meter."

Mr. Oliver G. Pike, *F.Z.S., F.R.P.S., M.B.O.U.,* the celebrated photographic naturalist, has been supremely successful with his film, "Nursery Island." The achievement is in the rarity and interest of the scenes, combined with perfect photography made under difficult conditions of light. Mr. Pike attributes the excellence of the exposures entirely to the accuracy and reliability of the "AVO" Exposure Meter. He writes :—

"I made over one hundred separate shots . . . in constantly changing conditions of light, exposing altogether 5,000 feet of film from 7 a.m. to 8 p.m. The exposure was *absolutely uniform throughout* and as correct as it was possible to get it. My 'AVO' told me the right stop to use every time, and I cannot speak too highly of it. . . . On the Farne Islands the light is exceedingly strong and deceiving. In some instances my 'AVO' gave readings which seemed impossible, but I relied upon it throughout and obtained perfect results."

The choicest subjects for photography are so often fleeting incidents. They never recur in precisely the same setting and conditions. The certainty that you will have a successful exposure is the paramount consideration and the most satisfying encouragement. Wasted film is one thing, wasted opportunity another—far more disappointing and exasperating. *You* can be sure of correct exposure *every* time if you use the New "AVO" Exposure Meter.

Prov. Patent

Can be used without removal from leather case.

The New "AVO" EXPOSURE METER

63/-

Morocco Leather Case, 5/- extra

BRITISH MADE

- Unique method of exposure indication.
- Greater sensitivity. Gives exposures from 60 seconds down to 1/2,000th of a second.
- Exceedingly compact, for vest pocket. Size only $2\frac{1}{2}'' \times 2\frac{1}{8}'' \times 1''$
- Can be held and operated in one hand, without removal from leather case.
- Influenced solely by light received from normal picture angle.
- Robust and absolutely dependable.

FOR 'STILL' or CINÉ CAMERAS

Obtainable at all good photographic stores. Fully descriptive leaflet post free from :

THE AUTOMATIC COIL WINDER & ELECTRICAL EQUIPMENT CO., LTD.

Winder House, Douglas Street, London, S.W.1.

Telephone : Victoria 3404–7.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Some Notes on Kodachrome for Holiday Shots in Colour

By J. C. GREEN.

MANY readers of "The A.P." who are keen cinematographers will be trying Kodachrome for the first time during the present season. If they had not thought of doing so I suggest that they expose at least one reel during the holiday on a specially selected subject. Their only regret when they see the result projected later will be that they did not make all their shots by this remarkable colour process.

Among the attractions of Kodachrome, its simplicity in use is outstanding. For the majority of shots, especially at close and medium range, no filters or special technique are necessary, and filming is simplicity itself. Nevertheless, circumstances do arise when some control can be used with advantage.

Kodachrome is especially partial to the extreme ends of the spectrum; the blue and the red; less so to green.

When filming a landscape with blue haze in the distance, or in which the sky is reflected from water in the foreground, a rendering tending to an excess of blue often results. The haze is exaggerated, and the water may come out a deep violet. The same colour will be evident in cast shadows, and a glossy black, such as a motor car or tarmac road, may be distinctly blue.

Not only does the film eagerly record the large amount of blue light which is present, but much invisible ultra-violet affects the emulsion and is also recorded as blue.

In these circumstances, a simple remedy is to use the very pale ultra-violet filter, which many of us already use for a similar purpose in monochrome work. Messrs. Kodak issue a special filter for this purpose, but if an ultra-violet filter is already available, it will be found quite suitable. An ordinary yellow filter will not serve. A flat lighting, with the sun behind the camera, and a minimum of shadows, is best for this class of colour cinematography.

At the other end of the spectrum, a tendency to overdo the red may be observed, when the light is rich in this colour. Such occasions are early morning and late afternoon, out of doors; and under half-watt light indoors. The effect is to degrade the other colours with a brownish tinge, especially the greens. Foliage, in particular, unless of a very pure green, and not in direct sunshine, will suffer.

A similar effect is observed with super-sensitive pan. film, when the familiar "snow on the trees" results from sunlight directly reflected by the leaves. It is well known that foliage reflects much infra-red, which, though invisible, is capable of affecting a sensitive panchromatic emulsion sufficiently to upset the colour rendering.

Avoid direct sunlight on grass and trees where possible. If it is unavoidable, try, experimentally, a very pale "panchromatic" filter of the green variety. For half-watt lighting, the pale blue filters, used for the same light with panchromatic stock, improve the rendering considerably. Be sparing with the make-up for models to be taken by half-watt light.

The *quality* of the light used for projection also has an important bearing on the colour rendering. Those who are accustomed to under-run their lamps with a view to a long life will not get the best from any colour film.

The foregoing observations are only intended for those who insist on the utmost fidelity in colour rendering. Under ordinary conditions the results are so attractive that any slight departures from perfection will not be noticed by the average observer.

Kodachrome can give beautiful results with no more care than ought to be given to monochrome work, and only special cases require special measures. Whenever any rendering appears untrue or overdone, first see that the fault is not in the eye of the beholder. After cultivating monochromatic vision for a long period, it is necessary to become colour-conscious to realise what we have missed.

Holidays for the "Taking"

By M. A. LOVELL-BURGESS.

THE amateur ciné enthusiast turns his summer holiday into a scenario. He keeps his ciné camera within reach of his hand and learns to be "quick on the draw."

One of the faults of memory is its incompleteness. Certain events stand out clearly in retrospect, but the host of details which made up the happiness of the hour are gone for ever.

This is not so when the ciné camera is called in. Years later, looking at your own films, a hundred forgotten associations of colour, sound, emotion, provide a silent, yet none the less vital, commentary.

The aim of your holiday film will be to present as complete a record as possible.

In a camping holiday, for instance, people like details. They like to see how you get your water, they enjoy watching you erect your tent, especially if you have trouble with it, and the detailed preparation of the bacon and eggs for breakfast will be watched with the keenest interest.

Incidentally, a ciné camera forces you into being an optimist. If you are on a cycling holiday and you have a breakdown, if you are held up by an irritatingly large flock of sheep, if your car runs out of petrol, have your ciné camera handy. By the time your friend has rehearsed a frown for the benefit of the camera you will have to laugh. Even the inevitable washing-up attached to a camping holiday becomes exciting as an action-subject. And if it rains be on the look-out for the fine cloud effects you can often get when the sun suddenly shines again.

Landscape, however charming to your eyes, has a way of "falling flat" in a holiday film. Much has been written about the introduction of movement into landscape, figures in the foreground, and so on, but perhaps one of the best ways of all is to dramatise scenic pictures by taking them in the early morning or late afternoon sunlight, when long shadows and softer lighting will then give "features" for your camera.

Most country fields can provide animal subjects to complete your landscape. Cattle bunched in the shadow of a tree do more than anything to suggest a really hot day. Cows resting deep in buttercups, or wading half-way into the stream, give the authentic country atmosphere as well as fill in blank spaces.

Before you take your picture, unless you are using colour film, mentally translate the colour in the scene into light and shade. Remember, these are the only tonal values in cinematography. And it is a help where composition is concerned to remember it is always the brightest objects which first focus the attention of your audience.

Finally, although detail is vital, do not let it swamp the romance of your particular holiday. There is balance in choice of subject, as well as in its ultimate composition, and our job as amateur cinematographers is to see life steadily and see it whole. Most people have their dreams of a caravan at rest in the dappled light beneath the dreaming trees; of a punt making its slow way along still waters between daisy-shadowed banks; of a white ship speeding south, with the sea dark as wine, and the sky an inverted bowl of light. These are true aspects of our holidays, and they are ours for the "taking," not only for the magic moment but for all our to-morrows.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

The Secretary of The Royal Photographic Society informs us that colour prints submitted for Section IIa in the forthcoming R.P.S. Annual Exhibition may be sent framed, provided that the outstanding dimensions of the frames do not exceed the standard sizes for the mounts, namely, 20 × 17 or 16 × 12 in. The final day for receiving prints is August 14th.

Hampshire House Photographic Society.—At the Annual General Meeting of the Hammersmith Hampshire House Photographic Society, a successful year's work was reported, the membership, which now stands at 239, having shown a slight increase. Mr. N. W. Wilding is now Hon. Secretary of the Society. His address is Broom Lodge, Loseberry Road, Claygate, Surrey. The Switch Memorial Cup, which is awarded to the member who is held to have rendered the greatest service to the Society during the year, was presented to Mr. J. Hooper, who has been responsible for the construction of new studio equipment.

A new photographic developer with outstanding qualities has just been introduced by Messrs. Johnson & Sons, of Hendon Way, Hendon. It is called "Meritol," and is intended for the production of negatives of extremely fine grain. Our preliminary tests with this developer have demonstrated that these claims are well sustained, The image secured is of pleasing warm-black colour by transmitted light, and cream by reflected light, but the most notable characteristic, however, is the almost complete absence of grain, the image obtained being of even finer quality than that secured with paraphenylene diamine. For this reason it is particularly suitable for the development of miniature negatives that require considerable enlargement. In use, the developer is fairly rapid, and shows no tendency towards staining or fogging, and the makers claim that it keeps well both in crystalline form and solution. The formula is extremely simple to make up, as "Meritol" requires only the addition of sodium sulphite, no alkali being necessary. We hope to make further tests with this developer in the near future, and to comment on its properties at greater length. Messrs. Johnson inform us that it is quite a new chemical and that they have applied for patents regarding it. This firm has also introduced a "Super Fine Grain Developer" containing "Meritol," which has all the qualities of their well-known "Fine Grain Developer," with the added advantages of the new chemical. It is supplied in powder form ready for dissolving in warm water. Further particulars regarding "Meritol" will be supplied by Messrs. Johnson and Sons at the above address.

The Bayswater and Paddington Photographic Society has appointed a new Hon. Secretary, Mr. W. T. Green, 113, Queen's Road, Bayswater, W.2. An attractive syllabus for the coming season is in preparation, and all photographers in this neighbourhood should write for full particulars of the Society.

The next photographic ramble organised by the Southern Railway will be on Sunday, July 26th. A special train leaves Victoria at 9.30, and the old Tudor villages of Penshurst and Chiddingstone will be visited. The return fare is 3s., and the leader will be Mr. A. E. Daly.

A reader, Mr. S. Gregory, 69, Selwyn Street, Leigh, Lancs, lost his camera when travelling from Manchester to Wigan. The instrument was a new 6 × 6 Super Ikonta with ever-ready case. The number of the camera is 48236, and has Tessar f/2.8 lens and coupled range-finder. Any reader who can help in the recovery of this camera should communicate with Mr. Gregory at the above address.

The latest winner of the Wallace Heaton Competition is John Taylor, 142, Bierley Lane, Bradford, Yorks. Full particulars of this competition for readers of "The A.P." will be found in our advertisement pages.

The Finlay Colour Co., Ltd., of 174, Mill Lane, Hampstead, London, N.W.6, have just issued a new catalogue which contains full information and working details regarding the Finlay Colour Process. Every reader who is interested in colour photography should obtain this booklet without delay. It will be sent free on application to the above address.

Stolen Cameras.—Messrs. E. A. Atkins, Ltd., 19, St. John's Hill, Clapham Junction, S.W., inform us that the following cameras were stolen from their premises on the night of the 13th inst. Exakta Multispeed B, No. 432835, f/1.9 Dallmeyer lens, No. 168376, £36; Zeiss Ikoflex, f/4.5 Novar, No. Y15950, £7 15s.; Zeiss Nettar, f/4, Telma D.A., £5 10s.; Cine-Kodak 8-20, f/3.5, No. 40456 H4, £9 17s. 6d.; Kodak Six-16 Junior, No. 18668, £2 7s. 6d. Any one who can give any information regarding these cameras should communicate with Messrs. E. A. Atkins at the above address.

A Prize Competition for Novices

THIS competition is specially for those readers of "The A.P." who are Novices; that is to say, amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups, or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

Our readers who are Novices have all the summer in which to make their prints for this competition, and the prizes are worth having.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.
The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.
The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.
Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 30th. This will give new readers who are Novices, and who intend entering this competition, every opportunity of improving their work during the next two months by reading *The Amateur Photographer* every week and obtaining their competition prints during the summer holidays.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices" Competition.

Further reference to the competition will be made week by week, and hints given for the best treatment of various subjects for Novices.

IF BUY A CAMERA YOU MUST—

The trouble about this advertising is that it keeps us constantly at work thinking out fresh ideas for catching the public's eye. Hunting round after some new, meretricious method of drawing attention to our unworthy selves, we stumbled on something distinctly original in the publicity line from America. This novel and subtle trend was first discernible in the advertisements of whisky distillers who began praising temperance and urging their customers not to indulge in whisky (well, maybe just a short one now and then). The idea seems to have spread to car manufacturers, who are advising war veterans to "hold on to their bonds."

There is just the faintest suggestion that if one simply can't help buying, that their particularly "vibrationless 8" is the next best thing to economy, but the whole tone suggests thrift and self-denial as proper national virtues.

Unfortunately, we couldn't see our way to adapting this dictum to our own case. "Don't buy, but if you have to, buy it from us," didn't seem to ring true. The prosperity of the country at the moment seems to warrant our exhorting prospective camera buyers to buy cameras galore. In fact, we feel that we shall have to keep our adaptation of this particular stunt until the next slump, which, if Karl Marx was right, is somewhere round the corner.

The only part of the scheme we can in fact subscribe to is the rider "—if you have to, then get it from us." With this we are in enthusiastic agreement. The new camera is certain to be a miniature. What could be more reasonable, more altogether appropriate, than to buy it from the miniature camera specialist?

We have just received our first delivery of the new Contax Model III and of the Super Nettel Model III.

The Contax Model III resembles closely in its general specification the Chromium Model II, but has the addition of a built-in photo-electric exposure meter It is thus the first miniature camera of the range-finder type to be equipped in this way. We might add that the increase in bulk is negligible. Price, with f/2.8 Tessar lens, **£55 17 0**; with f/2 Sonnar, **£63 0 0**; with f/1.5 Sonnar, **£78 5 0.**

The Supper Nettel III differs radically from the Super Nettel II. In appearance it resembles the Contax Model II, but is definitely more pocketable. The speeds on this camera remain from 1/5th to 1/1,000th sec., but the lens has been made interchangeable.

Telephoto lenses of two different focal lengths will be available for this model.

Prices: With f/3.5 Tessar, **£28 5 0**; with f/2.8 Tessar, **£32 0 0.**

Buy your Contax III or Super Nettel III from the Miniature Camera Specialist. We shall be pleased to take any existing apparatus in part exchange.

THE FOLLOWING LIST REPRESENTS A SELECTION OF USED MINIATURE CAMERAS FROM OUR STOCK. WE HAVE, BESIDES THESE, THE MOST COMPREHENSIVE COLLECTION OF NEW MINIATURE CAMERAS AND ACCESSORIES TO BE FOUND IN GREAT BRITAIN. OVER FIVE HUNDRED DIFFERENT ACCESSORIES FOR THE LEICA CAMERA ONLY ARE TO BE SEEN AT OUR SHOWROOMS

WITH EACH OF THE SECOND-HAND CAMERAS LISTED BELOW WE GIVE A WRITTEN GUARANTEE OF MECHANICAL AND OPTICAL PERFECTION.

CONTAXES:

Contax Model I, wedge-type range-finder, f/1.5 Sonnar lens, ever-ready case. As new.....£42 10 0

Contax, as above, but with f/2 Sonnar lens.....£32 17 6

The following Telephoto Lenses will fit either Models I or II Contax:—

Zeiss 8.5-cm. f/2 Sonnar Lens. As new.....£26 10 0

Zeiss 18.5-cm. f/6.3 Tele-Tessar. As new.....£20 10 0

Zeiss 12-in. f/8 Tele-Tessar, with filter and special case. Cost £48. As new £30 0 0

Contax Plate Back, £3 5 0. Extra Slides, 5s. 6d. each. 42-mm. Filters: Dark Red, 12s. 6d.; Green, 12s. 6d.; Light Yellow, 9s. 42-mm. Proxars: No. 1, 12s. 6d., No. 2 12s. 6d. Contax Magniphot Enlarger, to take lens from camera. Excellent condition. £61 7 6.

LEICAS:

Leica Model IIIa, fitted latest pattern rectilinear focussing f/1.9 Hektor. Unsoiled in any way.....£35 0 0

Leica Model IIIa, f/2 Summar lens, ever-ready case. As new.....£34 10 0

Leica Model III, black, f/2 Summar lens, ever-ready case. As new.....£31 10 0

Leica Model III, black, f/3.5 Elmar lens, ever-ready case. As new.....£24 10 0

Leica Model II, black, f/3.5 Elmar lens. Excellent condition.....£18 10 0

Leica Model II, black, f/2.5 Hektor lens. As new.....£21 10 0

Leica Model I, f/3.5 Elmar lens, interchangeable. Excellent condition....£10 10 0

Leica Model I, f/3.5 Elmar, non-interchangeable. Good condition.....£7 18 6

Leitz 3.5-cm. f/3.5 Elmar, coupled, nickel.....£6 7 6

Leitz 7.3-cm. f/1.9 Hektor, coupled, non-rectilinear focussing. As new....£18 10 0

Leitz 7.3-cm. f/1.9 Hektor, coupled, rectilinear focussing. As new.....£21 10 0

Leitz 13.5-cm. f/4.5 Elmar, uncoupled. Good condition.....£7 5 0

Leitz Copying Arm, with rotating plate to fit enlarger column.....£6 17 6

Leitz Valoy Enlarger, 20-in. column. As new.....£7 15 0

Leitz Valoy Enlarger, 40-in. column. As new.....£8 5 0

Leitz Filoy Enlarger, with lens.....£5 15 0

MISCELLANEOUS:

Contaflex, f/2 Sonnar lens, ever-ready case. As new.....£55 10 0

Latest 6×6 Automatic Rolleiflex, f/3.5 Tessar, Rapid Compur, ever-ready case. As new.....£20 10 0

Automatic 6×6 Rolleiflex, f/3.8 Tessar, Compur, ever-ready case. Excellent condition £16 15 0

Automatic Rolleiflex 4×4, f/2.8 Tessar, normal Compur, ever-ready case. As new £17 10 0

Rolleicord, f/3.8 Triotar, ever-ready case. As new.....£11 17 6

Exakta Model A, f/3.5 Ihagee anastigmat. Good condition.....£11 10 0

Exakta Model A, f/3.5 Tessar. Excellent condition.....£13 17 6

Exakta Latest Lever-wind Model A, f/2.8 Tessar, case. As new.....£19 10 0

Multi-speed Exakta, f/1.9 Dallmeyer Super-Six lens, extension tube, lens hood, universal case. In excellent condition.....£26 10 0

Voigtlander Superb, f/3.5 Skopar. As new.....£11 17 6

Ikoflex Model II, f/3.5 Tessar lens, Rapid Compur, case. As new.....£16 17 6

Zeiss Baby Ikonta, f/3.5 Tessar, Compur. As new.....£7 5 0

Baldi, 16-on-V.P., f/2.9 Trioplan, Compur Rapid. As new.....£6 10 0

Kodak Nagel Pupille, 16-on-V.P., f/2.8 Tessar, Compur, ever-ready case. As new £12 15 0

Kodak Nagel Pupille, f/3.5 Leitz Elmar lens, Compur, special reflex attachment, Excellent condition.....£12 15 0

Weltur, 16-on-3½×2½, f/2.8 Tessar lens, Compur shutter, coupled range-finder combined with view-finder. As new.....£17 15 0

Zeiss Super Ikonta 530, f/3.5 Tessar, case. As new.....£13 10 0

Zeiss Super Ikonta 530/16, f/3.5 Tessar, Rapid Compur. As new.....£19 17 6

Zeiss Super Ikonta 530/2, f/3.8 Tessar, Rapid Compur, ever-ready case. Cost £24. As new.....£19 10 0

Zeiss Ikonta 520, f/3.5 Novar, Rapid Compur. As new.....£7 7 6

Foth-Derby, f/3.5 lens. Good condition.....£3 15 0

Foth-Derby, f/2.5 lens. Good condition.....£5 12 6

DEVELOPING AND PRINTING OF 35-MM. FILMS.—OUR DEVELOPING SERVICE FOR LEICA AND CONTAX FILMS IS THE ONLY COMPLETELY SPECIALISED ONE IN EXISTENCE. WE SUGGEST THAT SERIOUS AMATEURS WHO FIND THEMSELVES NOT IN A POSITION TO DO THEIR OWN WORK AND WHO HAVE HAD BAD EXPERIENCE OF ORDINARY COMMERCIAL SERVICE SEND THEIR FILMS TO US. DETAILS ON REQUEST.

CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, July 31. Rules in the issue of June 24.

Wallace Heaton "35-mm. Film Competition." Cash prizes every week. Open to readers of *The Amateur Photographer* only. Full particulars in advertisement page in this issue.

XVme Salon International de Photographie de Bruxelles.—Open, May–October. (M. Maurice Broquet, Secretaire du Salon, Rue du Sceptre, 77, Brussels.)

Salon International de Fotografica de Madrid. (Señor Secretairio de la Sociedad Fotografica de Madrid, Calle del Principe, 16, Madrid.)

The Listener. Cash prizes for photographs under general title "Conversation Pieces."—Open, July 8–August 25. Entries, Monday morning of each week. First selection in *The Listener* of July 22. (Editor, *The Listener*, Broadcasting House, London, W.1.)

Chicago International Salon.—Open, July 23–October 4. (Alex. J. Krupy, Chicago C.C., 137, North Wabash Avenue, Chicago, Ill.)

I International Kunstphotographische Austellung in Karlsbad.—Open July 18–August 9. (Hugo Heyer, Schulgass, 26, Karlsbad.)

XXXIe Salon International D'Arte Photographique de Paris.—Open, October 3–18. (M. E. Cousin, Secretaire de la Société Française de Photographique, 51, Rue de Clichy, Paris (9E).)

Radio Photo-Club de Spa. IVme Salon International de Photographie.—Open, August 9–30. (M. René Chalsèche, Avenue Marie-Thérése, 13, Spa, Belgium.)

I Salon Internacional de Fotografia de San Sebastian.—Open, August 5–20. (Sr. Secretario General Salon Internacional de Fotografia de San Sebastian, Calle San Marcial, 26, San Sebastian, Spain.)

Forty-fifth Toronto Salon of Photography.—Entries, July 25; open, August 28–September 12. (W. H. Hammond, Secretary, Toronto Salon of Photography, 2, Gould Street, Toronto, Canada.)

Museum and Public Library, Maidstone. Exhibition of Nature Photography.—August 15–29. (C. E. Fisher, Museum and Public Library, Maidstone.)

Tweede "Focus" Fotosalon.—Entries, August 10; open, September 12–27. (Focus, Ltd., Fotosalon, Bloemendaal, The Netherlands.)

South African International Salon.—Entries, August 14; open, October. (Hon. Secretary, Johannesburg P.S., P.O. Box 7024. Johannesburg, South Africa.)

Royal Photographic Society Annual Exhibition.—Entries, August 14; foreign entries, July 31; open, September 12–October 10. (Secretary, R.P.S., 35, Russell Square, London, W.C.)

Buffalo C.C. Fourteenth Annual Salon of Photography.—Entries, August 15; open, September 6–27. (H. W. Schonewolf, 528, Elmwood Avenue, Buffalo, N.Y., U.S.A.)

Morecambe, Heysham and D.P.S.—Entries, August 19; open, September 9–16. (James F. Levisohn, B.Sc., 5, Douglas Drive, Heysham, Lancs.)

Fotoclub Zagreb. Fourth International Salon of Photography.—Entries, August 20; open, October. (Fotoclub Zagreb, Masarykova II, Zagreb, Yugoslavia.)

London Salon of Photography.—Entries, September 2; open, September 12–October 10. (Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

Lincoln Camera Club.—Entries, September 5; open, October 15–November 12. (Miss E. Redfern, 146, Burton Road, Lincoln.)

XII Salon International de Fotografica, Zaragoza, Spain.—Entries before September 10; open, October. (Secretary, Sociedad Fotografica de Zaragoza, Plaza de Sas, 7, Zaragoza, Spain.)

Third Canadian International Salon of Photographic Art.—Entries, September 10; open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, National Gallery of Canada, Ottawa, Canada.)

Windlesham C.C.—Entries, September 10; open, September 25–26. Classes for members (Beginners, Advanced, Professional, also Open Class). (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

IV International Hungarian Exhibition.—Entries, September 15; open, October 24–November 9. (Secretary, Magyar Amatörfényképezök, Orsz. Szövetsége, Budapest VII, Erzsébet-körut, 9, Hungary).

Rotherham P.S. Forty-seventh Annual International Exhibition.—Entries, September 21; open, October 14–17. (E. George Alderman, Ruardean, Newton Street, Rotherham.)

Service Co. (London), Ltd., Happy Camp Snaps Competition. Cash prizes.—Entries, September 30. (Service Co. (London), Ltd., 273, High Holborn, London, W.C.1.)

Coronet Midget Camera Competition. Cash prizes.—Entries, September 30. (Coronet Camera Co., 310, Summer Lane, Birmingham, 19.)

Eighth International Photographic Salon of Japan.—(Entries close in Tokyo, September 30; open, November Tokyo and Osaka). (Sec., International Photographic Salon, Tokyo, Asahi Shimbun, Tokyo, Japan.)

Johnson's "Holiday" Competition. Cash prizes.—Closing date, October 31. (Johnson & Sons, Ltd., Hendon, N.W.4.)

U.P. International Exhibition of Photography, 1936 (Lucknow).—Entries, November 1; open, December 5, 1936–February 4, 1937. (Dr. K. N. Mathur, D.Sc., A.R.P.S., Hon. Sec., U.P. Amateur Photographic Association, Lucknow University, Lucknow.) Entry forms obtainable also from the Editor of *The Amateur Photographer*.

Tenth International Christmas Salon of Pictorial Photography (Antwerp).—Entries, November 15; open, December 20, 1936–January 3, 1937. (J. Van Dyck, Sec., Fotographische Kring "Iris," Ballaestr. 69, Antwerp.)

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. They are printed in either the vertical or horizontal form as shown here, and each is complete in itself.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 × 3, supplied for card index cabinets.

The collection when completed will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index, and are now ready. The size of the box is 5½ × 3½ × 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, S.E.1. Price 2s. 6d.

18. PERMITS

HAND cameras can be used in practically all the London Parks and Open Spaces. If, however, a stand camera is used a permit is required. For the Royal parks, i.e., Hyde Park, Green Park, St. James's Park, Regent's Park, Bushy Park, and Hampton Court Park and Gardens, permission can be obtained from the Secretary, H.M. Office of Works, Storey's Gate, Westminster, S.W.1.

For all other parks in the London area under the control of the L.C.C., permission is granted on application to the Chief Officer, Parks Department, County Hall, Westminster Bridge, S.E.1.

Hand cameras and ciné cameras for substandard film can be used without permission in the Zoological Gardens (Regent's Park and Whipsnade). For stand cameras a fee of 2s. 6d. is charged. Apply, The Secretary, Zoological Society, Regent's Park, London, N.W.

For Burnham Beeches, Epping Forest, Coulsdon Common and Highgate Woods, permission for stand cameras is obtained from the Town Clerk, Guildhall, E.C.2.

For Castles, permission is granted in most cases on personal application.

For Cathedrals, permission to use a camera is generally granted on application to the Dean. In most cases a fee is charged.

For Westminster Abbey, apply the Chapter Clerk, The Sanctuary, Westminster. Fee of 5s. is charged for each photograph.

For St. Paul's Cathedral, apply the Dean's Verger.

For The Tower of London, apply the Resident Governor.

Houses of Parliament, apply the Secretary, Lord Chamberlain's Office, House of Lords.

19. EXPOSURES FOR MOVING OBJECTS

THE following tables are designed to indicate minimum exposures for moving objects passing across field of lens at approximately 25 yards distance, and f/ number required for correct exposure. The exposures given are based on those required by films and plates rated as ultra-rapid in "The A.P." monthly exposure table.

To use the tables: First note the shutter speed required in table A. Then note the f/ number required in table B. Finally, alter this f/ number according to table C.

TABLE A.

Type of Subject.	Speed in m.p.h.	Shutter Speed.
Pedestrians ..	5	1/50th
Slow Moving Traffic	10	1/100th
Sailing Races ..	15	1/150th
Foot Races ..	20	1/200th
Rapidly Moving Traffic	25	1/250th
Cycle Races .. } Horse Galloping .. }	30	1/300th
	40	1/400th
High Diving ..	50	1/500th
Speedway Racing ..	60	1/600th

TABLE B.

Shutter Speed ..	50	100	150	200	250	300	400	500	600
F/ No. (Bright Sun) ..	16	11	11	8	8	5.6	5.6	4	4
F/ No. (Dull)	11	11	8	8	5.6	5.6	4	4	4

TABLE C.

In May, June, July, August	F/ number as stated above.
In March, April, September, October ..	Double the aperture stated above.
In January, February, November, December	Treble the aperture stated above.

It should be noted that the apertures given above are the smallest permissible, and that if a loss in depth of focus is of no consequence, the next larger stop may be used.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Subscription Rates: United Kingdom 17/4, Canada 17/4, Other Countries 19/6 per ann. post free from the publishers, Dorset House, Stamford Street, London, S.E.1. Telephone: Waterloo 3333. Telegrams: Amaphot, Sedist, London.

Ciné Exposures.

For rapidly-moving objects various tables of exposures have been published, and these exposures may be 1/500th or 1/1,000th of a second, to get a sharp image. Why is it, then, that sharp pictures are obtained with the comparatively long exposures of a ciné camera?
W. M. (Monmouth.)

The separate ciné pictures, or "frames," are not sharp all over in such cases. The rapidly-moving parts are more or less blurred in each frame, as an enlargement from one would clearly show. When the film is projected, the rapid sequence of blurs conveys the impression of rapid movement.

Chloro-Bromide Developer.

Will you supply me with a glycin formula for chloro-bromide paper? I want one that will make it possible to vary the tone. A. F. (Lanark.)

Make up these two solutions:—

A.	Sodium sulphite ..	2 oz.
	Sodium carbonate ..	½ oz.
	Glycin	½ oz.
	Water to	20 oz.
B.	Sodium carbonate ..	4 oz.
	Potassium bromide ..	10 grs.
	Water to	20 oz.

The standard solution is A, one part; B, one part; water, two parts. Warmer tones are obtained by increasing the exposure, and adding a rather larger proportion of B, and more water. Careful experiments must be made to arrive at the correct adjustments.

Ammonium Persulphate.

Although there is, I know, a formula for a stock persulphate solution that will keep, I cannot trace it. Can you help me? M. A. S. (Swansea.)

A formula is:—

Ammonium persulphate ..	1 oz.
Sodium sulphite	2 oz.
Sulphuric acid	50 min.
Water to	10 oz.

The working solution is 1 oz. of this and 9 oz. of water.

Converging Uprights.

In the accompanying photograph of Windsor Castle why do the upright lines slope towards each other? Is the lens at fault, or should I have used a smaller stop? O. C. (Grantham.)

Neither of the suggestions you make has anything to do with the case. You tilted the camera upwards in order to include the tops of the buildings. This must not be done except with cameras having a swing-back. A rising-front, which can be brought into action even with a hand camera, will often do away with any need for pointing the lens upwards, but if no such movement is fitted the only alternative is to do what you yourself have done. It is generally possible to remedy the distortion when enlarging from the negative.

Time and Temperature.

If I know the tank development time at a temperature of 65° Fahr. how can I tell what allowance to make for other temperatures?
D. C. (Taunton.)

As you presumably have no reference table for the developer you use, we would suggest that you try a method that has been recommended. The usual time of development at 65° is 20 minutes, and 65+20=85. You will find that the number of degrees and the number of minutes will make the same total in other cases. Thus at 62° you give 23 minutes.

Equivalent Focus.

What is the significance of the word "equivalent" used in regard to the focus of a lens?
C. R. (London.)

If it is said that a lens has an equivalent focus of x inches, it means that the scale of the image is the same as that of a "single" lens with a focal length of x inches. With a single lens the distance from lens to screen is its focal length; with other forms of lenses this is by no means always the case.

Fixing Film.

After I have developed and rinsed a spool of film can I cut it up for fixing? L. K. (London.)

There is no reason against this, provided you do not expose the film to actinic light while cutting, and you should get the films into the fixing bath as quickly as possible. You must also see that the films are moved about so that the hypo has free access; they must not lie in heaps.

Stale Bromide Paper.

Some time ago you described a method of restoring old bromide paper which gave foggy prints; can you repeat the instructions for my benefit?
B. P. C. (Norwich.)

Carry out operations in a light safe for bromide paper. Soak each sheet for one minute in:—

Potassium permanganate	5 grs.
Sulphuric acid	30 min.
Water	50 oz.

Transfer for one minute to a bath of water containing 20 grs. sodium sulphite to the ounce. Wash, and either use at once or dry it in the dark for future use.

Artigue Process.

Where can I obtain Artigue paper, of which I have seen occasional examples in exhibitions?
F. L. (London.)

We have been unable to trace any source of supply in this country. Workers of the method often prepare their own paper, as in the case of gum-bichromate, which it somewhat resembles. The same remarks apply to a kindred method—Papier Velours. You will find instructions for preparing the paper and working both processes in *The Dictionary of Photography*, under the heading "Artigue's Process."

Supplementary Lens.

With a fixed-focus camera what is the rule for finding the focus of a supplementary lens to bring near objects into focus? How can I find the new values of the stops? S. B. (Hull.)

The focal length of the lens must be equal to the distance of the object from the lens. If you want to get an object sharp at 6 ft. from the lens you must add a convex lens of 72 in. focal length; if the object is 4 ft. away, a 48-in. lens. No one lens will serve for all distances. The f/ value of the stop is unaltered in these cases.

Thermometer Degrees.

How can I convert Fahrenheit degrees into Centigrade, and vice versa? C. D. L. (Stafford.)

Fahrenheit to Centigrade: Subtract 32, multiply by 5, and divide by 9. Centigrade to Fahrenheit: Multiply by 9, divide by 5, and add 32.

Casket Lenses.

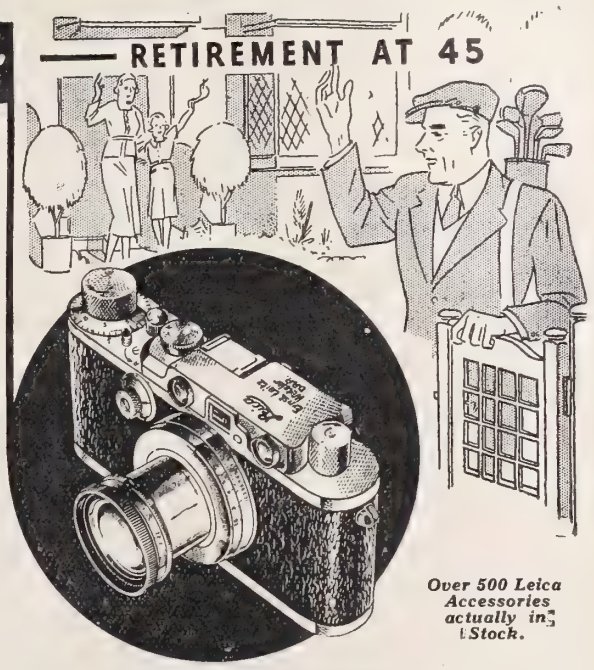
I have heard "casket" lenses mentioned. Can you tell me briefly what is their special construction and use? T. M. (Conway.)

Formerly several makers produced sets of single lenses of various focal lengths, all threaded so as to screw into one mount, either one or two at a time. Singly and in combination they gave the equivalent of a considerable range of lenses—single, rectilinear and wide-angle. The set of lenses was fitted into a case or casket—hence the term, which has no reference to the construction. The utility of such a set is obvious.

Things you've always longed for

Who, of the world's workers, has not longed for early retirement with leisure and sufficient means to indulge in one's hobbies. Even the greatest gluttons for work have fallen a prey to such daydreams, in the same way as the most modest photographer has often longed to own

A Leica CAMERA



Although the retirement dream may not come true—the Leica dream can. No need to wait until your ship comes home. For the modest sum of 15/6 a week you can enjoy all the thrills of Leica photography. That is, photography **all** the year round—in any light—at any time of day or night. The range of Leica photography is so comprehensive that it is impossible to deal adequately with it in a single small advertisement.

With its interchangeable lenses and other practical accessories there is no photographic problem which the Leica cannot successfully tackle. Every lens is coupled with the built-in precision range-finder, making focussing quick and easy. The focal-plane shutter has the amazing range of speeds from 1 to 1/1,000th sec.

Numerous other features are explained in Leica literature, sent post free on request.

Question

"What is the best film to use for general outdoor photography at this time of year?"

Answer

"'Panatomic'—undoubtedly. It is fully panchromatic, renders the colours of the countryside in their true black-and-white relationships, gets full cloud detail. And it has a superfine grain—makes rich contact prints and clear brilliant enlargements however small the negatives. 'Panatomic' is made in Roll Films and Film Packs, and in 35 mm. form for miniature cameras. Get some from your Kodak Dealer to-day."

KODAK LIMITED · KODAK HOUSE · KINGSWAY · LONDON, W.C.2

THE London Salon of Photography 1936.

SENDING-IN DAY, Wednesday, September 2nd.

THE TWENTY-SEVENTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at The Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 12th September, to 10th October, 1936.

CONDITIONS OF ENTRY (Please read carefully).

1. Pictures must not be framed; but may be mounted or unmounted. Each picture must bear on the back clearly written a) name of artist; (b) number and title of picture, corresponding to particulars on the Entry Form.
2. When mounts are used they should conform to the following sizes—25 × 20, 20 × 16, or 15 × 12; but no mount to exceed 25 × 20; and it is suggested that white or light-toned mounts be employed. Prints may be of any shape or size, provided they do not exceed the limits of the mounts as given above.
3. All packages of exhibits from abroad must be clearly marked on the outside: "PHOTOGRAPHS FOR EXHIBITION ONLY—NO COMMERCIAL VALUE—TO BE RETURNED TO SENDER." *No prices to be marked on the prints.*
4. Pictures sent unmounted will be suitably mounted by the Salon Committee and all accepted pictures will be shown under glass.
5. Pictures must be sent by post or parcels post, packed flat and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.
6. All pictures for the exhibition must arrive at the above address *on or before* Wednesday, September 2nd. Entries may be delivered by hand at the Gallery on that date only.
7. The Entry Form for pictures from abroad must be sent SEPARATELY by post, together with entry and packing fee of 5s. (this fee covers any number of pictures from one exhibitor). Exhibitors residing in the British Isles may enclose Entry Form and fees with their pictures.
8. Pictures sent by post will be repacked in the original wrappings and returned, carriage paid, after the close of the exhibition.
9. As applications are made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify, in the space provided for the purpose below, whether they have objection to such permission being given. The copyright in all cases remains the property of the authors of the prints.
10. The Committee assure intending exhibitors that the greatest care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.

If pictures are sold a Commission of 15% is payable to the Salon.

The submission of pictures will be understood to imply acceptance of the above conditions.

Notification of acceptance of pictures will be sent out as soon as possible.

A Catalogue will be sent to each exhibitor.

¶ Readers of ***The Amateur Photographer & Cinematographer*** who are preparing work for this year's Salon may use this page as an ENTRY FORM.

SEE CONDITIONS.

¶ Intending Exhibitors who are unable to secure extra Entry Forms in time may prepare their own on plain paper provided the conditions of Entry are adhered to.

ENTRY FORM.

TO THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.

Sir,—I submit the undermentioned Photographs for the consideration of the Selection Committee, and I enclose **Postal Order** (or International Money Order) of the value of 5/- to cover Entrance Fee and the cost of return postage.

Reg. No. (leave blank).	A, B or C (leave blank).	Number on Picture.	Title of Picture.

DUNSCOMBE'S "PERSONAL" CAMERA COLUMN

'SERVICE SUPREME'

THE PRIVATE LIFE OF ELMAR ACOOS

It was precisely at three o'clock in the afternoon on the glorious first of June that Elmar Acoos first saw the light of day. Born of aristocratic parents in the family mansion at Wetzler, Elmar thrived from a very early age, and with the passing of time soon achieved a remarkable resemblance of his grandsire, one Hektor of Lysum, who had in his time travelled completely round the world in search of adventure.

Elmar's mother, a likeable and robust woman, had shared in her husband's trips, so it was not entirely unnatural that young Elmar should follow in his parents' footsteps as the years rolled by. At the time our story commences, Elmar had been sent to England to continue his studies, and after a rather nasty piece of the North Sea had been satisfactorily traversed, Elmar arrived safely and sound in London, and took lodgings at 20, Mortimer Street. It was at this period that there was a shortage of youngsters of friend Elmar's calibre in the West of England, and in response to urgent appeals Elmar decided to "go West" and duly arrived in Bristol, that ancient city noted for the University, Clifton College, Clifton Suspension Bridge, Tobacco factory, George's very excellent beer, and, of course, the old-established photographic dealers, Messrs. M. W. Dunscombe Ltd., whose premises are situated in the Tramway Centre, and alongside the water-front, the rendezvous of the local photographic enthusiasts (the shop, not the water-front).

Elmar very quickly made friends with his numerous playmates, and developed a strong affection for Miss Telyt Toolp,* in fact, both were seen together on many occasions in the Giraffe House at the famous Bristol Zoo. Another bosom pal of Elmar was Professor Lenz, that notorious character who migrated to Bristol from London some nineteen months ago, having safely dodged his creditors and outwitted the Headmaster of Narkover College.

As this enthralling serial is concerned with Elmar Acoos, and not the misadventures of Professor Lenz, we will speedily continue to deal with the former. Time passed very swiftly and pleasing with friend Elmar, who was soon initiated into the art of modern business methods in Messrs. Dunscombe's emporium and was permitted from time to time to inspect much of the correspondence that flowed continuously from the post box to the managing director's private sanctum and there sorted by a special, trained staff of handwriting experts—just part of the celebrated "Service Supreme."

NEXT WEEK: **ELMAR DOES A DEAL**

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer." The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged ; over £10 and under £50, 2/6 ; over £50 and under £75, 5/- ; over £75 and under £100, 7/6 ; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed **& Co.**

Notes being untraceable if lost in transit should not be sent as remittances.

IMPORTANT NOTICE

Owing to the August Bank Holiday, the issue of "THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER" for August 5th must be closed for press earlier than usual.

MISCELLANEOUS ADVERTISEMENTS for insertion in that issue can be accepted up to WEDNESDAY, July 29th.

FLIGHT & AIRCRAFT ENGINEER AND AIRSHIPS

The First Aero Weekly in the World

All the latest developments in connection with aviation are recorded in the pages of "Flight."

Illustrated descriptions of new aircraft, aero engines and equipment, British and Foreign, appear regularly, as well as practical articles giving the latest information for Club members and amateur pilots.

"Flight" is the leading authority on aviation. It contains Royal Air Force news, and deals with the work of R.A.F. Squadrons, with Private Flying, and with Commercial Aviation, Airlines, and Airports.

A special staff of highly competent aerial photographers ensures that "Flight" contains the finest photographs of aviation in all its aspects.

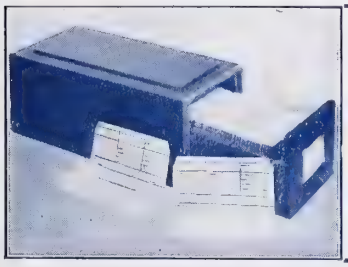
We will insure your Miniature Camera free if it cost £10 or upwards, no matter where it was bought. Write for full particulars.

We will register your Camera and send you publications that we think will interest you from time to time, free.



We will send "Leica News" to those whose Leica cameras are registered with us, free, also film record cards on request.

We have all Miniature Films developed in our own special fine-grain processing laboratory as a matter of course. This ensures the finest possible results at all times.

We make Automax 2½ × 3½ enlargements from all miniature films at 2d. each.

We offer big allowances on apparatus in exchange for new or second-hand miniatures. Write for particulars.

We have the best easy payments scheme and can offer you practically any goods for the addition of only 5 per cent on equal monthly terms, without large deposit. Write for particulars.

WALLACE HEATON "LEICA" NEGATIVE STORAGE FILE

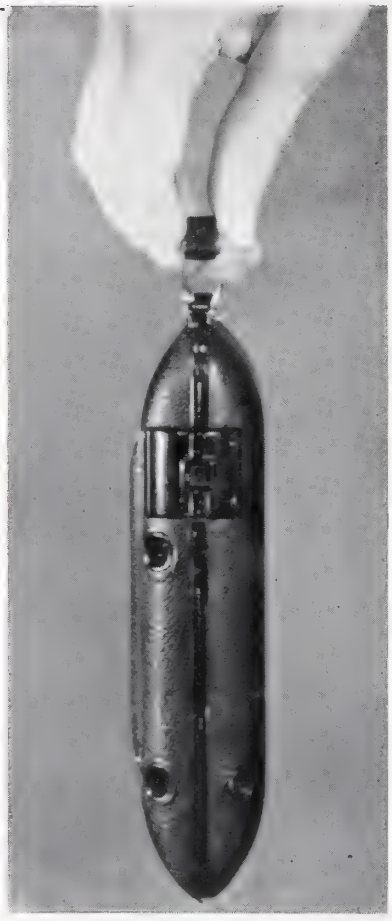
Capture Summer's Golden Hours

WITH THE **Leica**



THE HANDIEST AND MOST VERSATILE OF ALL MINIATURE CAMERAS

Ask any good-class photographic dealer for a demonstration, or write for descriptive literature to

E. LEITZ (LONDON), 20, MORTIMER STREET, LONDON, W.1

Copyright—Registered as a Newspaper for transmission in the U.K.

AN UNUSUAL CAMERA

You can see that at a glance

The "Regent" has been *designed*, not simply assembled. Look at its smooth 'streamlining'—no projecting parts at all, everything built right in. It's the handsomest camera made.

But, of course, it doesn't stop at looks. Consider the equipment: Coupled Rangefinder (no more out-of-focus pictures); Two Picture-Sizes Device (eight $3\frac{1}{4}$" by $2\frac{1}{4}$" or sixteen $2\frac{1}{4}$" by $1\frac{5}{8}$" on Kodak Film No. 620); Zeiss Tessar *f*4.5 Lens; Compur-Rapid Shutter (9 speeds up to 1/400th second; Delayed Action); Optical Direct Vision Viewfinder. Everything you need for good pictures—outstandingly good pictures—is here in the "Regent."

If you're thinking of getting a 'better camera,' this is a camera you must not miss. Ask your Kodak Dealer for interesting descriptive leaflet or write to

Kodak Limited, Kodak House, Kingsway, London, W.C.2.

Have you entered Wallace Heaton's 35-mm. miniature camera competition?

This competition is confined to pictures taken by cameras using 35-mm. film. Open from July 1st until September 30th. It does not matter what the subject is, but prints should not be smaller than 6 × 4 inches.

USERS OF
LEICA, CONTAX, CONTAFLEX, RETINA, ROLLEIFLEX & ROLLEICORD (if used with ciné film) can all compete.

Any number of prints can be sent in in any one week, but each photograph must have the coupon attached. Each photograph must have on the back a coupon as below, and the name and address of the sender, the make of camera and material used, exposure, etc.

In addition to the big prize, A WEEKLY PRIZE OF £1 1s. will be awarded for the best photograph submitted in that week.

For photographs which appeal to us, not necessarily prize-winners, we reserve the right to purchase the copyright by payment of £2 2s. ; in the case of weekly prize-winners by the payment of an extra 21/-. The copyright of the £25 prize-winning print must be made over to us without further payment. *In addition we are offering a special prize of £1 1s. per month for the best photograph submitted depicting a person or persons using a camera purchased from Wallace Heaton Ltd. All prints will be judged at the end of the competition for the final prize of £25 cash. Acceptance of these rules and conditions is a specific condition of entry.*

£25 will be awarded for the best photograph submitted during run of competition.

COUPON which must be attached to your entry.
WALLACE HEATON
35-mm. Film Competition.

Rolleicord

THE POPULAR CHOICE for HOLIDAYS

The Rolleicord saves you the expense of enlargements because contact prints are large enough to show the fullest detail of your pictures, 12 pictures on 3¼ × 2¼ 8-exp. roll film for 1/-. The separate viewing lens and focussing screen eliminate useless snapping because you see your picture full size and right way up, therefore you can reject all subjects which do not appeal to you *before* you have wasted film on them. The high-class Zeiss Triotar lenses will not only give you perfect holiday pictures, but will give excellent results all the year round. The Compur shutter is speeded from 1 second to 1/300th, also T. and B., and is set and released by one lever. The Rolleicord is so designed that it is easily manipulated.

Takes all Rolleiflex accessories excepting only the angle mirror.

Rolleicord, with Zeiss Triotar f/4.5 lens..... **£14:10:0**

Rolleicord, with Zeiss Triotar f/3.5 lens..... **£16:0:0**

ZEISS

PHOTOGRAPHIC LENSES—apart from their unquestionable superiority of design—are manufactured under such ideal conditions that

The BEST DEFINITION

is assured for each and every lens which succeeds in passing the stringent tests of the ZEISS factory.

For MINIATURE CAMERAS

the UTMOST PERFECTION of definition is a *sine qua non*, and neglect to insist on a ZEISS lens is undoubtedly responsible for many failures and much disappointment to owners of miniature cameras.

CARL ZEISS JENA

Write for List P. 51, and details of the best lens for YOUR camera to **CARL ZEISS (LONDON) LTD.**

THIRD EDITION

REVISED THROUGHOUT

PHOTOGRAPHY MADE EASY

By R. CHILD BAYLEY
Author of "The Complete Photographer," "Hand Cameras," "Photographic Enlarging"

AS EASY AS A · B · C

This is a book for photographic beginners, and, if carefully studied, it will enable the novice with a camera to get a greater proportion of successful photographs than would usually be the case.

"Photography Made Easy" should be read by everyone taking up photography: it should form as much a part of the outfit as the camera itself: it is an ideal present to give an amateur photographer.

A camera for the Serious Worker

is the new Ikoflex II. The large and plastic image on the screen, which naturally serves both as a view finder and focussing screen, will particularly appeal to those photographers who wish to pay special attention to picture composition.

- **The Ikoflex II is a precision-made twin-lens reflex for 12 pictures 2¼×2¼ in. on the usual 3¼×2¼ in. roll-film spool.**
- **A special collective lens, matted on the underside, forms the focussing screen and ensures an extraordinarily brilliant picture. Quadrant focussing lever automatically shows the depth of focus for any aperture.**
- **Zeiss Tessar f/3.5 in Compur Rapid shutter to 1/500th second, or Zeiss Triotar f/3.8 with Compur Normal to 1/300th second.**
- **Self-erecting hood with large magnifier for focussing sharp pictures, also convertible to direct-vision view-finder.**
- **Metal fittings are chromium-plated and the covering is outlined in neat chromium-plate.**

IKOFLEX II

With Zeiss Tessar f/3.5 .....£20 10 0
With Zeiss Triotar f/3.8.....£14 15 0

Most high-class camera dealers stock the Ikoflex II. Name of nearest stockist, together with Ikoflex booklet, free on request.

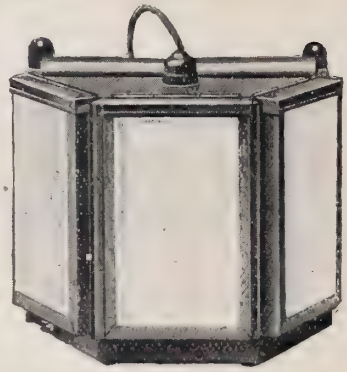
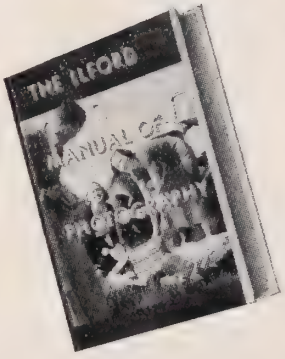
With these ILFORD aids to Finer Photographs

ILFORD PHOTO-ELECTRIC EXPOSURE METER



Absolutely accurate exposures improve the work of any camera. The Ilford Photo-Electric Meter shows instantly the correct exposure for any subject under all conditions. For Plates, Films, Cine Films and Dufaycolor materials. Price: **£3-3-0** in neat leather case.

ILFORD COLOUR FILTERS



There is a wide range of Ilford colour filters for landscape and general photography. Prices according to size. Full details of all Ilford Filters in leaflet "Ilford Colour Filters and Adjustable Holders."

ILFORD DARKROOM LAMPS & SAFELIGHTS

Safeguard good camera work with good darkroom lighting. Ilford darkroom lamps are made in many types, but have one characteristic in common—each ensures a high degree of illumination with perfect safety. Fully descriptive literature sent free on request.

THE ILFORD MANUAL

An enlarged and fully illustrated edition written by a staff of experts under the Editorship of Mr. George E. Brown, F.I.C., Hon. F.R.P.S., for 30 years Editor of *The British Journal of Photography* and the *B.J. Almanac*. In its 25 chapters, every branch of photographic work is covered and reliable formulæ given to help you add to your camera's capabilities. Price: **2/-** from all photographic dealers, or post free **2/6.**

ILFORD AMATEUR PHOTOGRAPHIC HANDBOOK

For beginner and experienced amateur alike, this book is a valuable guide to better results. Profusely illustrated and covering such subjects as the choice of a camera, the right film or plate to use, exposure, developing, printing, etc., it is of absorbing interest to every camera-owner. Price: **1/-** from photographic dealers, or post free **1/4.**

TOPICS of the Week

CAN the Camera Lie? the subject of our new competition announced in the Summer Number of "The A.P." last week has already attracted considerable attention in the daily press, which devoted a flattering amount of space to notices of the issue. Particular attention was paid to the competition and the articles illustrated with typical examples of "Pictorial Inexactitudes." Knowing the keenness of our readers and their skill with the camera, we look forward to some novel and amusing results and a big entry by the time the closing date arrives—September 30th. For the benefit of new readers who did not see last week's issue we repeat the simple conditions. Prizes of 5 guineas, 3 guineas, 2 guineas, 1 guinea and 10s. 6d. will be awarded for the best efforts in making the camera untruthful. The prints entered must be quite straight and from untouched negatives—which must be submitted for inspection if required. Combination prints or prints that have been built up by cutting out and copying or prints produced by control methods are not eligible for this competition. A coupon for "Special Competition" will be printed every week in our advertisement pages and one must be affixed to the back of each print.

Yacht Photography.

Many thousands of amateur photographers who are now taking their holidays at the seaside, particularly those who are at the South Coast, will be revelling in the opportunities presented for getting good yachting pictures. The great yachting carnival at Cowes opens next week, to be followed by regattas at several other places on the coast. Here is a subject that will not only appeal for the pictures that can be obtained of racing yachts in action, but it is one that the possessor of practically any kind of camera can attempt with confidence. The light on the sea is always brilliant, and is at its maximum at this time of year. The reflected light from the water always helps, with the result that the cheapest form of camera with a very small aperture in the lens will secure brilliant, fully-exposed snapshots of these subjects as good as those obtainable by the worker with an expensive outfit. All that has to be remembered is not to over-expose and to choose the best viewpoint for showing the yachts well lighted, to emphasise the modelling of the sails. If the photographer is afloat, "close-ups" will provide some strikingly attractive results. A lens hood and filter will also add to the perfection of the tone values of the photographs.

A TYPICAL "COWES" SNAPSHOT.

A subject within the range of practically any type of camera and lens. 1/50th sec., f/16. Pan. film.

Photography of Lightning.

Writing in these pages recently (July 8th) a contributor told how easy it was to photograph lightning, and, this being so, a correspondent wonders how it was that photography had been in existence nearly sixty years before the fact was discovered. It seems to be agreed that it was at 10.30 p.m. on the night of September 2nd, 1882, that "Jove, for the first time, was induced to write his autograph on a photographic plate in the form of a wavy line." The result, however, was not a pronounced success, and it was not until three years later—August 15th, 1885—that a really perfect rendering of a forked flash was secured. The photographer was Mr. W. N. Jennings, of Philadelphia, who, arrayed in an old rubber coat, planted his tripod and camera on the roof of a house, and the full

story of the event may be found recorded on page 603 of the 1895 volume of the "Photographic News." He states that Nasmyth, of steam-hammer fame, in the year 1856, was the first to call attention to the erroneous character of a lightning flash as drawn by artists, and that it was not until about 1882 that artists ceased to picture lightning in zigzag form, Sir Frederic Leighton being one of the first, if not the first, to picture lightning flashes in the shape of a wavy line with branches.

Everybody Congressing.

Oh to be in London now mid-summer's there! They say internationalism is dying, but if it is to be judged by international congresses it is more alive than ever. A correspondent says that next week he is attending his sixth international congress since May, and all of them in London. The subjects range from social reform to micro-biology, but never were there so many eager folk wanting to learn and to impart. If you had waited outside Bedford College in Regent's Park or University College in Gower Street last week you would have seen members of every nationality under the sun—or moon—and have had the opportunity for some interesting personal studies. Only it comes quite as a surprise that many of these earnest visitors carried little cameras and were equally intent upon securing curious specimens for their albums from among their hosts.

The Wider World.

Dr. Walter Clark, of the Eastman Kodak Company, who was well known before he left this country as a popular exponent of scientific photography, has been reminding an American audience what a potty little world this would appear to be if photography had never been invented. Take the stars, for instance; we should have no conception of their multitude if it were not for photography. Supposing we were photographing a portion of the constellation of Orion, and gave two exposures, one of them being one hundred times as much as the other. If the shorter exposure showed a few of the most prominent stars, the longer one would reveal a very much larger number of stars, large and small. Perhaps at the bottom of the photograph would be the great first magnitude blue star Rigal; above it the Sword Belt, and in the curve of the sword an object which does not form a sharp image on the photographic plate, the great nebula of Orion, one of the most wonderful objects in the sky. Photographed in the high-power telescope, in the middle of the nebula is a dim cloud of light, in the words of Jeans, "looking like drifting masses of smoke such as one sees when a house or a haystack is on fire." In the same way as the photographer has been able to penetrate the haze on earth, revealing the detail of the distant landscape, so the astronomer has been able to penetrate the nebulous haze of star dust, revealing images of faint stars which in the ordinary photograph are masked by the luminous gases.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Home-made Solutions.

I realise that it would be a great advantage if I could prepare solutions, etc., from formulæ. Do you advise this sort of thing for the amateur, or is it not worth while? Is a chemical balance expensive? What other accessories are needed?

E. A. (Mitcham.)

We think most decidedly that an enthusiastic amateur is seriously handicapped unless he has facilities for weighing and measuring. This is particularly the case if he does a variety of work, or if he likes experimenting with new or modified methods suggested by other workers. There is no difficulty whatever in carrying out the necessary operations of weighing and measuring, and the requirements are few and inexpensive. You would probably save the cost in a short time.

To begin with, a chemical balance of the expensive type used in laboratories and elsewhere is quite unnecessary for this purpose. A set of scales and weights can be bought for a few shillings from or through anyone dealing in photographic apparatus. The weights will be of the apothecaries' type, and will probably range from 1 grain to 2 drachms (20 grs. = 1 scruple, 3 scr. = 1 drachm). Larger quantities, say, from ½ oz. to 1 lb. can be weighed with the household scales.

It is best to have the brass pans of the scales fitted with removable "watch-glass" pans, as these can easily be kept clean.

Then you will want a few glass graduates—say 1 dram (for minims), 1 oz., 4 oz., 10 oz. and 20 oz. You will also require a stirring rod or two of glass or vulcanite, and later on, at any rate, a funnel for filtering through papers or cotton-wool. A thermometer has its uses, as it is sometimes necessary to have water at or about a stated temperature. Such an outfit should just about meet your requirements.

You will meet with formulæ stated in metric terms. These you can of course convert, but it is a good plan to have a supplementary set of weights based on the gramme, and graduates on the cubic centimetre. It is just as easy to use one method as the other.

Naturally, you will need a stock of "chemicals," but these will depend on the scope and character of your work, and if selected with discretion need not be very numerous or expensive.

Edgings to Enlargements.

I use a vertical enlarger, and sometimes want a narrow white edge to the prints, and sometimes a black one. I find it awkward to get either by treating the negative. Can you suggest a better way?

W. A. E. (London.)

For a white edge a black paper mask can be used with the negative in the carrier. There are two objections: the edges of the mask get damaged; and it is difficult to cut a small mask sufficiently accurate to stand enlargement. For a black edge the clear margins of the negative may be trimmed away.

We suggest the following alternatives.

For a given size of paper obtain two or three pieces of flawless glass of exactly the same size. Along the edges of each paste four strips of thin black paper, so as to obtain openings of various sizes and proportions. If you make all your prints to a standard size you will need only one such mask. Lay the sheet of glass, strips downwards, on the bromide paper when making the exposure, and you will get clean-cut white edges.

For a black edge, use a glass on which has been pasted a sheet of paper the size of the actual picture, leaving a margin of clear glass all round. After exposing, put a yellow cap on the lens, lay the glass on the bromide paper, remove the negative, and give an exposure to clear light. The edges will develop up black.

The margin, whether white or black, should be a little wider than required, and trimmed afterwards.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

The Photographer on Tour

The photographer on tour has to consider the points dealt with in the following article. Attention to them may make all the difference in the results, between failure and success.

AT the present time there are many photographers who are about to start on a holiday tour, in which photography will take some part. It may well be that the tour will be mainly planned with a view to making the most of photographic possibilities, but in many other cases the camera will have to take a secondary place, especially if the photographer is a member of a party, and the needs of other people will have to be taken into consideration.

This does not mean that good use cannot be made of the camera, but whatever form the tour is to take it is necessary to give attention to the points that are dealt with in this article, as photography on tour differs in several respects from photography done in a particular locality.

The Photographic Tour.

If the photographer is in the happy position of being able to plan a tour mainly from the point of view of photographic interest, and particularly if he specialises in certain types of subject, there will be no difficulty, with the aid of books, in deciding upon the route to follow.

In making plans care should be taken to allow of sufficient time to deal with all possible subjects, because it is better to cover a smaller area and to do it well rather than to attempt too much.

It is well to work to a time table, bearing in mind that the time allowed is likely to be exceeded rather than being too long, and there is always the possibility of modification being called for. The specialist will not wish to hurry if he finds good subjects, and it is wise to refrain from doing so.

The Camera on Tour.

The tour which is not planned with regard to photography, or if the photographer is a member of a party not entirely photographic, needs special consideration. People are as a rule quite willing to wait while the photographer secures his pictures, but the halts should not be too prolonged or too frequent.

The photographer who makes too many demands will not be popular although he may atone as the "official photographer" by taking "snaps" of members of the party, or incidents on tour, although these may be revolting to his photographic ideals.

Apparatus.

The apparatus for the touring photographer needs special consideration. The type of subject that is anticipated and the means of transport must have some consideration. It may also mean that in this other members of the party must be thought of.

For example, a reflex camera may not appear very weighty or take up much room, but in a small car, packed to capacity, this may take up more than its fair share of room. The cyclist or the hiker will certainly choose a small, light camera.

The photographer touring with a party will also have to consider another aspect of the case. If the other members of the party are not greatly concerned with photography, halts may be made by consent for pictures to be obtained.

In this case a camera of the miniature type is ideal, because no other type gives the opportunity for short exposures in the hand, or for the making of a large number of exposures in a short space of time. Also during the longer halts, while the other members of the party go sightseeing, the user of a small, quickly operated camera has a means of securing a large number of pictures.

On the other hand, he may decide to be content with fewer exposures, and to continue the use of his pocket plate or film-pack camera, and concentrating upon a few carefully selected subjects.

Sensitive Materials.

The touring photographer, if he uses a camera of the popular size, and his route takes him through moderately large towns, will probably decide to purchase supplies *en route*. Most chemists in the smaller towns sell one or other of the panchromatic roll films in the most popular sizes, although there is no certainty that any one make will be obtainable; 'chrome roll films can be bought almost everywhere, even in the smallest villages.

With regard to the purchase of supplies, one hint may be given. The photographer should be careful as to the purchase of films at village stores of the general type, which also stock a variety of other articles. The film may be of standard make, and be within the date of expiry on the carton, but there is no guarantee that it has had proper storage, away from damp or injurious fumes.

Plates, being less in favour than in the past are a different proposition. While in the large towns most chemists, and all photographic dealers, stock some plates, it does not follow that the photographer will be able to get his favourite brand. It is better to take a supply of plates, or to arrange with a firm of multiple chemists, who have a branch in a town along the route, to have a box or two to be called for. This can be arranged through the manager of the local branch of the firm.

Dark-rooms.

The plate user will want a dark-room for changing. Care must be exercised in the exposure of plates in strange dark-rooms, particularly in regard to the illumination. It is far better to wait until nightfall, and to use the darkest corner of a bedroom. Light may be dispensed with, but if the worker feels that he likes to see what he is doing, one of the small electric dark-room lamps will meet his needs.

After Exposure.

When touring, care must be taken to protect exposed plates and films. Plates should be replaced in their original packing, an extra plate-box being taken to start operations. The boxes should be sealed up with adhesive paper to prevent accidental opening. Roll films and film packs should also be sealed up in the same way. Exposed material is best packed between clothing, and in this way is afforded protection against vibration and damp.

Subjects.

The photographer on tour will not need to be told to look out for possible subjects, but it often happens that good subjects are missed, to ultimate regret. It is a good plan to examine the local views, not with an idea of making duplicates, but these will be found to give an indication of possibilities.

The photographer wants his own pictures, but commercial views help to show the type of subject that the place offers, and it is possible that time may be saved exploring unproductive fields through a study of local views, and the reading of a guide-book of the district.

The low viewpoint. Summer afternoon on the sands.

HIGH *or* LOW

By G. R. ROOKLEDGE.

MUCH is written about the importance of viewpoint in photography, but the value of a position above or below the normal is not often clearly indicated.

What are the advantages of a high viewpoint?

In the first place, the actual foreground is cut down, for much of it consists of aerial space. The middle distance has a greatly increased value since the horizontal lines running away from the camera are lengthened, while verticals are foreshortened.

The degree to which these effects are apparent depends upon the relative height above the subject and the angle at which the camera is held. In all cases, however, the horizon is raised and this is of particular value when the sky is cloudless, for by judiciously pointing the lens downwards it may be reduced to a minimum or eliminated altogether.

Care must be taken, though, to see that there are no parallel vertical lines to be distorted by this manœuvre, unless the distortion is part of the design.

When the downward tilting is carried to the extreme objects are seen more or less in plan, and by this means striking pictures can be obtained, but if it is carried so far as to render common objects difficult to recognise they will probably be dubbed "stunts."

If a low viewpoint is utilised the opposite conditions prevail as a rule. The foreground is greatly lengthened and may become troublesome; the middle distances are closed up, the horizon lowered and the sky given greater prominence.

This is often useful for giving an atmosphere of "airiness."

The greatly increased value of vertical lines enables quite small upright objects to be used to lead the eye into the picture by breaking any strong lines crossing it, such as the horizon, so giving cohesion to the composition.

High viewpoint. Breakers coming.

An extremely low viewpoint, however, especially when close to prominent foreground objects tends to destroy these advantages, for the undersides of such objects are then seen in plan and the position becomes an inverted high viewpoint.

There are great possibilities in this point of view, and it is by no means easy to handle successfully, but it is well worth investigating by the keen worker.

To sum up briefly, the high viewpoint is generally found valuable when the pattern is mainly in the horizontal planes, while the low viewpoint is better for designs in vertical planes.

The high viewpoint. Tide marks.

so frightfully good-tempered

The "miniature" for "miniature" pockets

Most amateurs would like to avail themselves of the undoubted advantages offered by the miniature camera, but are deterred from investing in such an instrument on account of its cost. For such amateurs Zeiss Ikon have designed the Super Nettel. It is a really moderately-priced miniature camera, constructed with true Zeiss Ikon precision, and is obtainable at the reasonable price of **£18 12s. 6d.**, equipped with Zeiss Triotar f/3.5.

The Super Nettel is provided with ● an all-metal focal-plane shutter speeded to a real 1/1,000th second ● patent rotating wedge distance meter coupled to lens focussing ● detachable back, facilitating cleaning and permitting the use of plates ● a folding baseboard protects the lens when out of use, and makes the camera very pocketable ● the Super Nettel may be said to be an ideal camera for those miniaturists who do not require the facility of interchangeable lenses.

The Super Nettel can be obtained with Zeiss Triotar f/3.5, Zeiss Tessar f/3.5, or Zeiss Tessar f/2.8, or Super Nettel II, illustrated, chromium-plated finish, de luxe model, with Zeiss Tessar f/2.8 .. .. **£28 : 2 : 6**

Those desirous of further particulars are invited to apply to their local stockist for a demonstration. Name of nearest stockist, together with Super Nettel booklet, free on request.

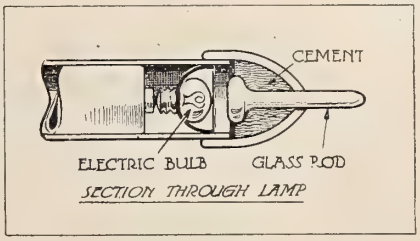
Readers' Hints, Tips and Gadgets

A "LIGHT" PENCIL FOR CONTROL WORK IN ENLARGING.



A LITTLE instrument which has been found very useful for control work in enlarging consists of an ordinary electric torch of the pencil type (obtainable quite cheaply at any electric supply shop) with a working point of light. This light pencil may be used while the print is in the developer, to suppress unwanted light spots, to strengthen shadows, and to fill up "spotted" areas.

The original pencil was contrived by covering the bulb of the torch with a cap of thin sheet metal, in the centre of which was a small pinhole. A later model, which is illustrated, has a working point of glass, made from drawn-out glass rod, suitably rounded at the end. This point can be actually rested on the print in the developer and the point of application thereby fixed with certainty. The cap used in this instance is contrived from part of a burnt-out electric switch, the glass rod being cemented into it. The light is controlled by pressing the clip-switch against the base of the index-finger, as indicated in the illustration.

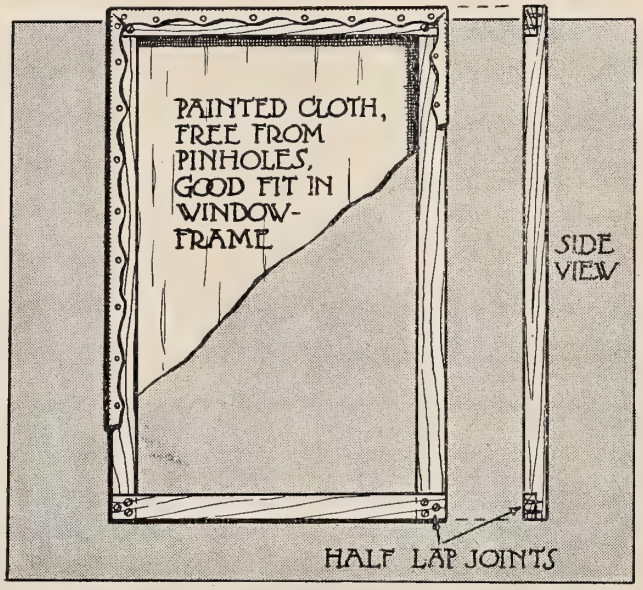
As the effect of the pencil is not instantaneous, but only appears as the developer acts, the use of this method of working-up requires a little practice. Once this has been acquired, however, the worker finds himself possessed of a very valuable aid.

ERIC SIDNEY.

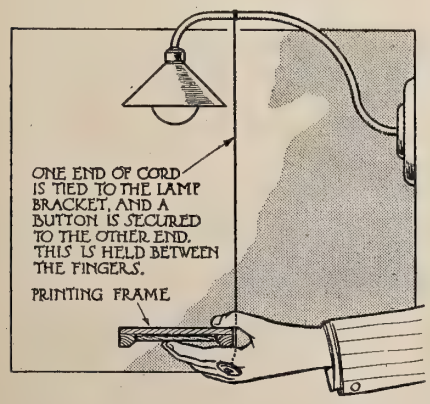
A CHEAP AND EFFECTIVE WINDOW SCREEN.

FROM time to time letters have appeared in "The A.P." in which enquiry is made as to the best and cheapest way of making a window screen for the temporary conversion of the bathroom into a dark-room.

The type here described has been used for four years by the writer, and is still going strong.



A frame is made of four lengths of wood of medium strength, joined together either in "picture frame" fashion, or by using a half-lap joint as shown. The latter type is on the whole preferable, as it is stronger. The frame should be just large enough to fit into the window space with very small clearance.



A thick but smooth cloth such as an old curtain is then stretched over the frame and secured by tin-tacks all round, like an artist's canvas. Any close-textured material can be used, but preferably dark in colour.

This is then given a thick coat of dark oil paint on both sides, and when dry it can be examined for pinholes by holding it up against the light. These holes are then blocked up by further dabs of paint, or, if necessary, another coat of paint.

The finished frame should fit snugly into the window space, without the necessity for anything else to hold it in place, but it may be necessary to fit small turn-buttons to secure it.

A. PROCTER.

DEVICE FOR ASSISTING CONTACT PRINTING.

FOR those amateurs who, for various reasons, are compelled to do their contact printing in any odd corner which happens to be available at the time the following tip might be of use.

It is a simple device to keep the printing distance constant without having to set up a table or bench for the purpose. A piece of string is fastened at one end to the electric light or gas bracket and at the other end to a large button. The string is placed between the fingers which rest on the button. The printing-frame is then placed on the palm of the hand facing the light. This will ensure prints of constant depth for any number of prints.

If it is found that the most convenient distance is too close to the light and makes the exposure time too short to be practical, a weaker lamp is necessary, or a piece of white tissue paper can be covered over the existing lamp.

Should, however, the exposing times be unduly long to be comfortable (20 to 30 seconds is an ideal period) it will be found that by halving the length of the string the exposures will be shortened to approximately one quarter of the time.

J. JONES.

The BACK VIEW

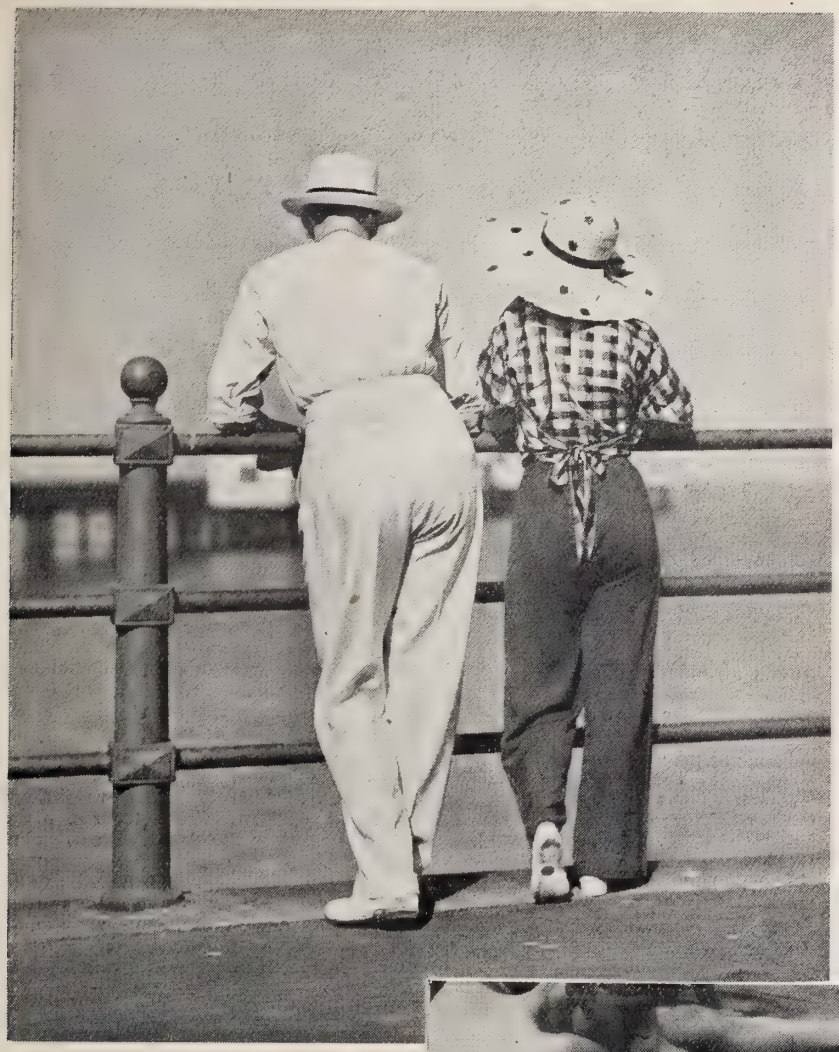
By W. H. JOHNSON.

IT is common ground that the inclusion or omission of a figure often makes or mars a picture. Ignoring cases where the figure obviously forms the chief *motif*, it has many other uses. As an instance, it may be mentioned that, because of our familiarity with its actual size or height, its use in a picture serves the invaluable purpose of affording a sense of proportion and giving scale to the other elements of the picture.

Again, how often has the amateur been attracted by a wide, open landscape, and, telling himself that here was an opportunity to secure an exhibition picture, exposed plates with high hopes in his heart, only to have those hopes dashed to the ground by the resulting prints? He finds that the scene which so attracted him is depicted as something dreary, flat, and uninteresting, and he now sees that what was lacking was some strong feature in the foreground. This would have served the purpose of accentuating distance and inducing a sense of atmosphere—that important quality without which no landscape can be successful. Here, a figure judiciously placed would have supplied the want.

In any case, however, it would have been fatal if the figure were facing the camera. The resulting picture most likely would be a portrait of "X," with a landscape as a background, but if the back of the figure were turned towards the camera it at once would have assumed its proper relative significance, its seeming unobtrusiveness veiling its true importance.

"The Game isn't what it was."



The Strollers Return.

Other ways in which the back view may be used will readily suggest themselves. It is especially useful in giving point or stress to some motive or idea. If reference is made to the first of the illustrations reproduced above, it will be seen that it would not have been possible to have captured the effect obtained in any other way than by making the exposure from a position behind the two figures. The use of the back view accentuates the confidential or conversational attitudes. It gives life to the figures and point to the picture which, incidentally, won an award in the photographic competition conducted by *Weekly Illustrated* last year.

No turning back.

"The Strollers Return" also instances an occasion when the back view was the more desirable. Had the two children been approaching the camera, it is more than likely that, at the moment of exposure, one or both of them suddenly would have looked at the camera, with the resultant

On the Promenade—Morning.

appearance of camera consciousness.

Another advantage in making use of the back view of a person is that the photographer may often take his time in making the exposure. If the person whose figure he desires to include is a stranger and facing the camera, most probably the exposure is a hurried one or not made at all, for not many amateur photographers will "snap" a stranger when the stranger can see what is being done.

The illustration "No Turning Back" is a suggestion for dealing with the familiar seaside bathing picture in a slightly different manner. Usually the method is to include the face of the bathing girl at all costs, yet this little snapshot tells its story even more clearly than would be the case if the figures were facing the camera, and at the same time there is a definite attractiveness in the pose and action indicated. The impersonal quality of the subject renders it attractive for competition or exhibition purposes.

The same applies to "On the Promenade—Morning." This is not only a striking arrangement, but the pose of the two figures is eloquent of the holiday spirit. It would have been difficult to have caught the same idea if they had not their backs to the camera, and here again the impersonal quality raises the print well out of the ordinary.

"Cheating the Sun" is frankly decorative, and the absence of portraiture all helps to make the snapshot a success. Although not exactly a back view it is near enough in this class to be included as a good example of a subject that can be tried with success at this time of year.

All these pictures are within the range of any snapshot camera and only need looking for to ensure their being secured with the minimum of trouble when found.

One other point. Although it has been pointed out that the back view tends to make figures "impersonal," this does not fully apply to those who know them. There is "character" in back views. Most of the people figuring in the illustrations would be recognisable to their friends, and we might bear this fact in mind when making portrait studies. The "half-view" also has its uses, as in the left-hand figure in the cricket subject.

Cheating the Sun.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

Four popular lectures, "Screen Colour Photography," "Romsey Abbey," "The New Forest," and "The Mother City of England," are now available to photographic societies. They are by Mr. R. M. Fanstone, who is a regular contributor to our pages, and he is prepared to deliver them without fee, but travelling expenses are payable. Application should be made to Mr. Fanstone, Palmerston Street, Romsey, Hants.

The Third Canadian International Salon of Photographic Art will be opened at the National Gallery of Canada in October, from the 23rd to November 15th. Every effort is being made to make the exhibition an international success. The last day for receiving entries is September 10th. At the conclusion of the exhibition the complete collection will be sent on a 5,000 mile tour of the Dominion and will be shown at the leading cities. Entry forms are obtainable from the Exhibition Secretary, Canadian International Salon of Photography, the National Gallery of Canada, Ottawa.

The second number of "Pauline Photography," the termly magazine of St. Paul's School, has come to hand and well sustains the excellent impression created by No. 1. The little magazine is finely produced and printed, and contains several informative articles. We congratulate the editor on his work.

A series of interesting travel lantern lectures dealing with Italy and Northern Africa is now available for photographic and other societies. There are nine lectures in all, and they are by Major Charles Howard, who is prepared to deliver them personally. Full particulars are obtainable from him at 18, Albert Road, Regent's Park, London, N.W.1.

The Hartlepools Amateur Photographic Society has changed its name to the Hartlepools Camera Club. The Hon. Secretary is F. C. Huntley, 22, Lynn Street, West Hartlepool, and the headquarters are at Birks Hotel, Church Street.

The second issue of "Photography with Rolleiflex and Rolleicord" is now available. This little quarterly publication contains matter of interest to all users of these popular cameras, and is well illustrated. It can be secured from all Rolleiflex and Rolleicord stockists at 1s., or direct from Messrs. R. F. Hunter Ltd., "Celfix House," 51, Gray's Inn Road, W.C.1, at 1s. 1d. per copy, post free, or 4s. 4d. post free, the annual subscription for four quarterly copies as issued.

A photo-electric exposure meter and a range-finder combined in one compact instrument no larger than $1 \times 2\frac{1}{2} \times 2\frac{3}{4}$ in. has been successfully achieved in the "Helicon," a Zeiss Ikon product. The photo-electric exposure meter is based on the same principle as the Helios exposure meter that has been on the market for over a year, and made by the same firm. The photo-cell glass is pointed to the subject and through a small window at the back an indicator is seen. A dial is then turned until this indicator is pointing at the principal mark and the exposure reading is then read off from the same dial. This dial is scaled for film speeds of 9/10° to 24/10° DIN, and from 20° to 35° Scheiner. Provision is made for weak light values, and also for day and artificial lighting. The total range of exposures varies from 1/1,000th to 80 secs. Immediately above the exposure meter lies the range-finder. This employs the very efficient principle of the dual rotating wedge glasses as fitted to the range-finders of many Zeiss Ikon cameras. The subject to be photographed is also sighted through a small window immediately above that of the exposure meter and a double image will be seen. By rotating a dial at the side, these two images can be made to merge into one when the distance, in feet, can be read off immediately on this same dial. A highly efficient dual instrument that is both simple to use and easy to carry in the pocket, the "Helicon" will appeal to those who desire precision in calculating exposures and distances. It is manufactured and supplied by Zeiss Ikon Ltd., 37/41, Mortimer Street, London, W.1, and sells at £9, including soft leather purse.

Another little book for the miniature camera worker has just appeared from the Fomo Publishing Co., of Canton, Ohio, U.S.A. This is entitled "Camera Journalism with the Miniature Camera," and is full of interesting and instructive matter for the free-lance Press photographer. It is written by George W. Hesse and is obtainable from Messrs. Sands Hunter & Co., Ltd., 37, Bedford Street, W.C.2, price 4s.

A special model of the "Sixtus" photo-electric exposure meter, which was reviewed in these columns recently has just been put on the market by J. H. Dallmeyer, Ltd., of 31, Mortimer Street, W.1. This new model has been designed for use exclusively with the Leica miniature camera. The meter is identical in all respects to the standard instrument as regards its construction and appearance. It is, however, calibrated to suit the special lens apertures and shutter speed incorporated in the Leica Camera. The price is the same, i.e., £5 5s. Further particulars will be sent on application to the above address.

Correction—An error occurred in the notices published in last week's issue regarding colour prints that can be submitted in frames to the forthcoming exhibition of the Royal Photographic Society. The largest size should be 20 × 16, not 20 × 17.

"The A.P." Monthly Competitions

AWARDS FOR JUNE.

"BETTER and better" described the prints entered for the June Competitions, and the judging has been more difficult than usual in consequence. The prize-winners, and practically the whole of those attaining Honourable Mention are quite up to exhibition standard, while several prints that have been placed in Class 1, as not up to the Honourable Mention level in this competition would, in many competitions in the past, have been among the prize-winners. This indicates that the standard of the entire competition is now getting steadily higher. The awards are as follows:—

ADVANCED WORKERS' SECTION.

First Prize.—"The Call," by Emile Laevaert, 199, Boulevard E. Bockstael, Brussels, 2e, Belgium.

Second Prize.—"The Old Testament," by Nowell Ward, 629, Melrose Street, Chicago, Ill., U.S.A.

Third Prize.—"The Finishing Touch," by Miss P. D. Kooka, Kooka Villa, B.J. Road, Bandra, India.

Mounting Prize.—"Preening," by William Jackson, 105, Park Grove, Hull.

Certificates of Merit.—"The Last Ray," by Arthur Keen, 328, Fourteenth Avenue East, Calgary, Alberta, Canada; "Scintillation," by H. W. Lambert, Cresswell, Ersham Road, Canterbury; "Summertime," by Mrs. K. M. Parsons, 83, Saint Peter's Avenue, Caversham Heights, Reading.

The prints not receiving awards have been grouped, those in the first group receiving Honourable Mention. The others have been marked Class 1, Class 2 and Class 3, respectively.

Those awarded Honourable Mention are as follows: Edward Alenius (Jamaica, N.Y.); H. F. Andrew (Walton-on-Thames); Mrs. D. Bailey (Goole); J. H. Clark (London, S.E.); (2) T. G. Corkill (Johannesburg); A. Howard Garmston (Bristol); James C. Gilchrist (Pitlochry); George Hilleard (Bromley); (2) William Jackson (Hull); Dr. S. D. Jouhar (Twickenham); Arthur Keen (Calgary, Alberta); Alan E. Lambert (Jamaica, B.W.I.); H. W. Lambert (Canterbury); Charles F. Lonsdale (West Hartlepool); (2) Mrs. K. M. Parsons (Reading); (2) A. Pitman (London, W.); (2) Charles E. Rollinson (Newport, Mon.); George A. Slight (London, S.E.); R. E. Townsend (Newton Abbot); (2) Kenneth M. Trathen (Redruth); G. T. Yang (Soochow, China).

INTERMEDIATE SECTION.

First Prize.—"South Foreland," by E. Cecil Milner, 40, Merton Hall Road, Wimbledon, London, S.W.19.

Second Prize.—"Interior of Tithe-Barn, Minster," by H. Turoff, 55, Charlotte Street, Fitzroy Square, London, W.1.

Certificates of Merit.—"Decanters," by Miss W. G. Hunt, 48, Kingsley Avenue, Ealing, London, W.13; "Sunset," by Hugh A. McDowell, 84, Melrose Street, Belfast; "East Wind," by R. H. Mead, Old Farm, Ottershaw, Surrey; "Speed King," by G. A. Roberts, 20, Capon Close, Swaythling, Southampton; "At the Well," by Lloyd Robinson, 4, John Street, Thornton, Bradford, Yorks.

BEGINNERS' SECTION.

First Prize.—"The Village Street," by Norman F. Goldman, Linslade, Richmond Road, Wolverhampton.

Second Prize.—"Before the Storm," by Miss B. Clough, Silsden House, Silsden, Near Keighley, Yorks.

Certificates of Merit.—"Old Minehead," by J. W. Clements, 11, Manton Avenue, Hanwell, London, W.7; "Chinese Junk," by E. W. Lomas, 288, Prince Edward Road, Kowloon, Hong Kong; "Promise of Harvest," by E. T. Mills, High Street, Lane End, High Wycombe, Bucks; "Reflection," by Frank Warren, Apt. 5, 377, Gladstone Avenue, Ottawa, Canada.

It's New!

...BUT SOMETHING MORE THAN NEW

A NEW FILM WITH A NEW QUALITY . . 'LASTIC LATITUDE'

NURO Film gives photographers essential features perfected to a far greater degree in NURO than in any other film. "Lastic Latitude," an exceptional degree of latitude, minimises the effect of incorrect exposure, while the high speed, fine-grain emulsion of this all-British film ensures a perfect gradation of light and shadow, and makes clear, crisp pictures certain.

IN ALL STANDARD SIZES

No.	Inches	Exposure	Price
N.27	1⅝ × 2½	8 ex.	1/-
N.29	2 × 3	6 ex.	10d.

Unbeatable "WESTEX" Roll Film Cameras

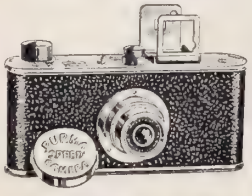
"WESTEX FOUR-FIVE"

8 or 16 on normal 3¼×2¼ film.

Very highest quality in every detail. Superb f/4.5 anastigmat, giving exceptionally fine definition, in focussing mount, delayed-action Prontor II shutter, 1 to 1/150th sec., T. and B. Sturdy all-metal body, plated edges, best leather covering and bellows. Quick self-erecting front. Optical direct-vision and brilliant waist-level finders. Hinged easy-loading back, panchromatic safety windows. Easy and delightful to handle, yet suitable for the most advanced work anywhere. By far the best all-round value offered. Obtainable only at the Westminster. **£4:8:9**

Nine monthly payments of 10/5.

Velvet-lined Leather Case, 6/9 extra.



"WESTEX JUNIOR"

Takes 8 pictures 3¼×2¼ on standard film.

Fine f/6.3 anastigmat in focussing mount. Self-erecting front, ready at a touch, direct-vision and brilliant finders. Quite unparalleled at its price. **42/6**

Nine monthly payments of 5/3.

'PURMA' Speed —New Miniature

Very simple and efficient. Excellent results. Instantly ready on removing lens cover. Takes 16 pictures on standard V.P. film. Unique self-adjusting focal-plane shutter giving 6 instantaneous speeds 1/25th to 1/200th sec. Compact and easy to carry.

35s. 0d.
COMPLETE

BALDAXETTE I

Takes 16 pictures on standard 3¼×2¼ film.

Coupled range-finder focussing, parallax-correcting finder, f/2.8 Xenar anastigmat, in delayed-action Compur shutter, 1 to 1/250th sec., T. and B., self-erecting front. **£18:5:0**

Nine monthly payments of 42/7

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

TALL SHIPS
on the Round Pond

By MERLYN SEVERN.

A PHOTOGRAPHER spending Sunday in London has a number of attractive hunting-grounds for his camera, and one of the most delightful is the Round Pond in Kensington Gardens. Children are always to be found there, and very tame swans, and those smartly turned-out little black-and-white ducks; but most fascinating of all, from the photographer's point of view, are the model yachts, which rival the swans in grace as they sweep across the water.

Any camera will do for this work; the simplest box-form will produce delightful pictures, for owing to the open nature of the subject, and the amount of light reflected from the water, a small-aperture lens is quite suitable. In many cases, too, great depth of field is required, to render sharply boats and people at various distances, so that the owner of a fast lens will often find it necessary to stop down.

A day which is slightly misty or overcast will generally be found to give better results than one of brilliant sunlight. In bright sunshine it is difficult to avoid over-exposing the white sails, with consequent "chalkiness" and lack of detail, if sufficient exposure is given to the darker parts of the picture.

The ideal day is one on which the sun is just strong enough to cast faint shadows, and in this weather lovely reflection effects can be secured. These are of two kinds: with the sun behind you, the sails show white in darker water; and against the light, the sails are dark in pale water. The latter effect is usually more interesting, but a lens hood is essential if the picture is not to be spoilt by the glare from the water being reflected into the lens. A hood can be improvised, at a pinch, by twisting a piece of black wrapping paper from the film carton or plate box into a tube of the right size, and fixing it in place with a rubber band, or even a piece of thin string; but a proper hood costs little and is more satisfactory.

Fitting out.

"Tuning up."

Getting ready for a race.

Besides the boats on the water, there are many amusing scenes to be found on the banks, for the larger yachts require a good deal of "fitting out" before they are ready to be launched, and these operations are frequently the centre of an interested circle of young people—of all ages! You will find that these shots require at least twice, and probably four times, the exposure of those taken over the water; there is no reflection to help the light.

The development of the negative requires a little care. If the pictures include white sails in sunshine, it is a good idea to develop for two-thirds of the usual time, and then to transfer the negative to plain water at the same temperature as the developer, for the remainder of the time. The developer left in the dense parts of the film soon exhausts itself, but that in the thinner parts goes on working much longer, so that the shadow detail has a chance to build itself up, without the white sails becoming too dense. Other pictures on the same roll, which have not the same high degree of contrast, can be printed on a more vigorous grade of paper to compensate for the softer development.

Exhibitions and Competitions CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, July 31. Rules in this issue.

The Amateur Photographer Novices' Competition. Prizes of Roll Film for Novices' Prints. Closing date, September 30. Rules in this issue.

"Beer is Best." The Winning Print.

The Wallace Heaton "ADVERTISING PHOTOGRAPHS" COMPETITION

OUR readers will be interested to see a reproduction of the print that was awarded the first prize of £25 in the recent Wallace Heaton "Advertising Photographs" Competition. This competition, which closed at the end of June, attracted a great number of prints from readers of "The A.P." and the standard of the work throughout was a high one.

The judge was Sir Charles Higham, who selected the print reproduced here, entitled "Beer is Best," as the best of all those sent in during the preceding three months. This print is by L. Tyler, 92, Bishop's Tachbrook, Leamington Spa. It was taken with a Rolleiflex camera, 1/100th of a second at f/5.6. The film used was Agfa Isochrom.

The prints that were selected as runners-up were the following:

"The Old Village Cobbler," by J. W. Sewell, Gunnerside, Highfield Road, South Shields.

"Wash Day," by W. K. Statters, 23, Southern Drive, Hull.

"Two Favourites," by H. Haddock, 47, Luxor Avenue, Harehills, Leeds.

"Where's my Food?" by A. E. Watts, 63, St. Augustine Road, Southsea.

"Some Shine," by C. Wendell Bleby, Cestrea, Beaconsfield, Bucks.

"More, Please," by Miss Iris Marsh, Marine House, Burnham-on-Sea, Somerset.

"Tickled to Death," by Reg. Moore, 13, Georgeville Gardens, Barkingside, Essex.

A new Wallace Heaton Competition is announced for the current quarter for users of 35-mm. still cameras. Full particulars will be found in our advertisement pages.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXLIV.

Mr. W. E. JOHNSTON.

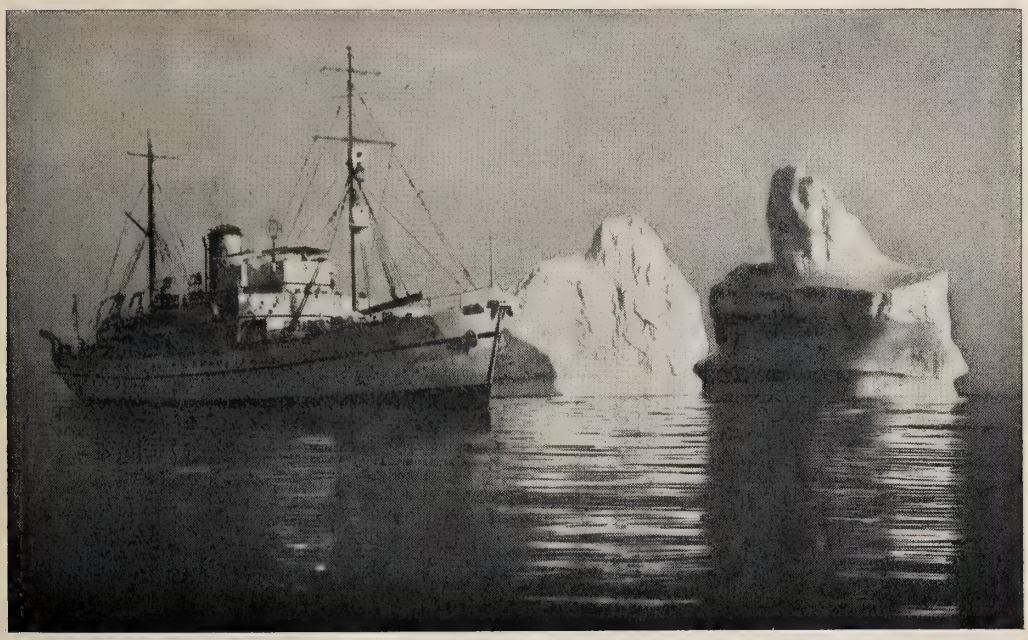
From information communicated to our Special Representative.

"FIRST a word about my cameras. There is the inevitable reflex—a Soho $3\frac{1}{2} \times 2\frac{1}{2}$, with a normal lens and a fixed-focus telephoto; there is a folding $3\frac{1}{2} \times 2\frac{1}{2}$ Icarette, which can be used with plates, film packs or roll films; and an old Icarette taking $2\frac{1}{4}$-in. square roll films. I generally use panchromatic material—plates, packs or roll films according to circumstances. Film packs and plates are developed in a Dallan tank with Azol, and roll films in one of those deep porcelain dishes that require only one hand, which makes developing in total darkness possible.

"Up to the present all my prints have been made on bromide or chlorobromide papers. I do not find it an easy matter to make a good bromide enlargement; when I do so, I shall be ready to try some of the other processes.

"As I like playing about with chemicals and bottles my developers, M.Q. and so on, are made up a gallon at a time, and stocked in small bottles. They last a long time, and are always ready for use. Hypo is bought five pounds at a time, and dissolved in a gallon of water. This is too strong for use, but is easily diluted as required.

"It may be of interest to know that my print washing is often carried over to the next evening. I give twelve changes altogether, and if it is getting late I give only three or four, and leave the prints in the water, face down, till the next evening, when the remaining changes are given. I have found no ill effects from doing this.



"For my subjects I look everywhere, and my small Icarette is generally in my pocket. In my rambles in town or country likely places are noted, and these are visited as often as possible when the lighting and other conditions seem suitable. Children are among my favourite subjects, and I have spoilt many plates and films trying to catch their elusive and charming expressions.

"I was in the Royal Navy when I first became interested in photography, and most of my work was then confined to taking and developing negatives and making contact prints. Enlargements were made at home during brief spells between foreign commissions. The best were mounted in albums, with dates and a few notes added to form a sort of diary.

"The influence of 'The A.P.' articles and criticisms is very evident when looking back through the pages of these albums. In 'The A.P.' I generally find detailed accounts of how to avoid the errors and poor results of the past.

"Most of my exhibition subjects nowadays are first submitted to the judgment of my fellow-members of the Portsmouth Camera Club. They are promptly parsed and analysed, dissected, chopped to bits and ground up. If there is anything left at all—which is seldom the case—the pieces are carefully gathered together, and the best of a bad job made for the next exhibition. They are a callous lot, these critics. The way they treat those masterpieces of mine, and of others, renders the expression 'cut-throat bandits' a term of praise by comparison."

(*A further example of Mr. Johnston's work is reproduced on one of the centre Art pages.*)

Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"A NORFOLK COTTAGE," *by N. R. Reedham.*

IN considering a picture of this type, it has to be kept in mind—if appearances count for anything—that it is an arranged subject, insomuch as a setting seems to have been chosen and a figure then introduced, and it is of a different character from those in which both figure and setting are caught without the connivance of the former.

As a rule, the latter class has the advantage of spontaneity but is subject to the drawback that the figure does not always harmonise with its setting or is not posed as well as could be wished, while the first-mentioned type is liable to betray its make-up, either by camera-consciousness, a woodenness of attitude, or a stiffness that suggests a simulation of arrested motion. Here, there is no trace of the first two, but there does seem to be just a hint of a feeling that, while the figure is intended to convey the impression that she is in the act of walking towards the cottage door, she is actually standing still for the photograph to be taken.

The responsibility for this rests more with the model than with the photographer, although, possibly, it might be said that the fact should have been observed and corrected at the time of making the exposure. However, she is otherwise entirely in keeping and very well chosen. Her pose is excellent, and the freedom from camera-consciousness such that an impression almost equivalent to spontaneity is conveyed.

As the sole human element, she naturally assumes the role of the principal item and serves as the centre of interest. Her position at (1) is fairly strong, being placed on one of a vertical division of thirds, and this strength is emphasised by the effective way her head is isolated against a dark portion of the setting, while the darker parts of her figure come against the light on the pathway. The sunlight on her head and shoulders, too, enhances her importance, and, altogether, she attains ample significance to maintain principality and ensure the necessary measure of unity.

On the other hand, her placing vertically is not so good. She happens to fall too near the middle of the picture, or, put in another way, there is too great an approach to equivalence in the spaces allowed above and below her. At the same time, there appears to be an excess of foreground, and nothing would be lost that is of any pictorial value if a good inch were removed from the base of the picture, i.e., along the dotted line of the sketch. The trim would have the further advantage of improving the position of the figure, and, in another edition, might well be tried.

The feeling of sunshine, perhaps, is not very strong, and, it seems, the sun was not shining at full force. It may have been partially obscured by a passing cloud, and some of its vitality, no doubt, may have been lost on account of the subject being seen against it, but it is somewhat curious to note that, while the figure casts a shadow, there is practically no evidence of sunshine on the cottage front.

It might be expected, having regard to its direction, that the open window-frames would cast a glancing shadow falling downwards towards the viewer, but nothing of the sort is visible, and, in consequence, the impression loses some of the effect it ought to convey. Admittedly, it is not an easy thing to keep all these considerations in mind in the stress of choosing a viewpoint, placing and arranging the figure, and seeing to the technical questions of focussing, determining the exposure, and making it, but it should be done, and, in the best work in this class, it is done.

There is room for improvement, again, in the treatment of the foliage forming the more distant parts of the setting. The bits of light showing through around the neighbourhood of (2) are rather distracting, and have the effect of drawing the attention away from the figure. Local working up with a carbon pencil, oil pigment, or any method that is familiar, would remove the disability and should be adopted.

Nevertheless, the picture does attain a measure of success, and, at least, does indicate a way of making a subject by the introduction of a figure into what, in other circumstances, could scarcely be sufficient in itself. The idea is excellent and shows what can be done with the aid of a suitable model, while the variations that can be made on the same theme are infinite and well worth exploring. The retention of a feeling of sunshine is, however, almost an indispensable necessity, and, whatever else should happen to be overlooked, care should be taken to keep the fact in mind. "MENTOR."

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

IT is undoubtedly a fact that an adequate exposure is a fundamental necessity towards the making of a technically perfect print. It is also a fact that with the modern plate or film, and dealing with any ordinary subject out of doors there is a considerable degree of latitude, so that, provided a certain minimum is exceeded, a wide range of exposures may be given without affording any noticeable differences in the resultant prints.

Latitude and Exposure.

Supposing we are dealing with a subject of the nature of No. 2, "Swallow Falls," by J. G. Muir. It represents an average landscape and there are no near darks to necessitate a special allowance or increase over what would be the ordinary exposure for its class.

According to our monthly tables, this would now be somewhere about 1/90th of a second at f/8, assuming that the speed of the plate or film falls into the ultra-rapid category, as do most of them in common use, and also assuming that the exposure was made in sunshine between the hours of 11 a.m. and 3 p.m. Any of the many types of exposure meters would give a near approach to the same reading, yet, providing development remain the same for each and every case, anything up to *eight times* that exposure would produce identical prints.

That is to say that anything between 1/10th and 1/100th of a second could safely be given without fear of over or under exposure. These figures go a bit beyond the exact ratio, but they are quoted to agree with the average run of shutter speeds, and the difference, at either extreme, is too small to matter.

In this particular instance, it would be unwise to increase the exposure beyond 1/50th because of the moving water in the foreground, for, otherwise, an undesirable amount of blurring of the image would, in all probability, become evident.

Fullness of Gradation.

It may here be remarked, incidentally, that, in cases approaching the border line, it is impossible to diagnose with certainty the presence of under-exposure of the negative from the print.

Errors in manipulation or in the choice of a printing paper may very easily produce a result that seems to denote a faulty exposure when such is not the case, but a sure indication can always be obtained from the negative itself.

If the darks of the subject are represented by clear glass or unobscured film, or if the deposit is no greater than that on the unexposed margins, under-exposure exists, but if there be a greater deposit in those portions than there is in the margins, the exposure is adequate. Over-exposure may be inferred when the negative is excessively dense throughout, is lacking in contrast, and highlight detail (represented by the heaviest deposit in the negative) is lost, assuming, of course, that development has proceeded for the normal time.

With "Swallow Falls," the gradation seems ample in the darker passages, and it is a reasonable inference that the exposure was adequate, nor, having regard to the vigour of the print, is there any reason to suspect over-exposure.

Technique and the Print.

It seems perfectly sound in its technical treatment, but, in the case of No. 1, "All is Peace," by Miss M. Reynolds, the blankness of the foreground in conjunction with the lack of sky tone leads to the inference that not only was there under-exposure in the first instance, but that it has been complicated with an over-development of the negative in an attempt to bring up non-existent shadow detail.

This, however, might be one of those borderline cases to which reference has been made above, and, while there is no doubt about the development being excessive in relation to the contrast range of the printing paper, it is impossible to be absolutely sure about the exposure without having a sight of the negative.

Nevertheless, there does seem a strong probability of its presence, and similar remarks are applicable, again, in connection with No. 6, "A London Silhouette," by C. J. Copsey, though, in this instance, the degree of over-development is even more marked. Reference to the negative will indicate whether under-exposure is present or not, but, with No. 7, "Quiet Corner," by N. A. Parinar, where the contrast is by no means extreme, the utter lack of tonal distinctions in the darker portions does seem to show that an appreciable measure of under-exposure exists.

Symptoms and Diagnosis.

The probability, here, is that reference to the negative will make the fault only too clear, and, if so, it is a case where something like four to six times the exposure originally given would be necessary to provide a fully exposed negative.

With Nos. 3 and 5, "The Falls, Dolgoch," by H. Wykes, and "Sunshine and Shadow," by W. H. Jackson, the prints are very flat, and while it is just possible that this state of affairs may be ascribed to under-development of the negative, or printing upon a type of printing paper that is much too 'soft' for it, it is more likely that under-exposure is the responsible factor.

Flatness is another symptom of under-exposure, but it is also produced by under-development, and, in these cases also, a certain diagnosis can only be obtained from the negative.

No. 4, "The Lane, Overstrand," by A. G. Ramsey, is, in common with Nos. 3, 5 and 7, an instance where it is necessary to make an allowance for nearby trees occupying the greater proportion of the picture, for which, according to our table, an exposure of 1/40th of a second—or at least double the first-mentioned example—is required, all other circumstances being equal.

Direct Illumination.

The need for an increased exposure will become apparent when it is considered how much direct illumination is cut off by the trees themselves, and how much more intense a dark appears the nearer it is.

It may be that, with No. 4, a fuller exposure might offer a somewhat more harmonious tonal scheme, but it does not seem noticeably deficient, nor is the contrast excessive having regard to the nature of the subject. Its foreground, too, is in shadow, and, with this in mind and the darks of the tree trunks also to consider, it provides an instance of one of those cases where the old-established rule—"Expose for the shadows"—should invariably be applied. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

TRANSFORMING A PHOTOGRAPH.

THERE are many ways in which a photograph can be used as an aid to producing a drawing or painting, and some of them are a great help to those whose skill is limited. Even if I had the time to draw a subject on the spot I should find the task a difficult one, but I can take a photograph in a fraction of a second, and thereafter can make a recognisable version of it in several different styles. Cripples need crutches.

Perhaps the most familiar transformation is to draw on a photograph with a pen and "fixed" ink, and then remove the silver image. A less familiar procedure is to make a pencil drawing by similar means. This is the one I propose to describe, incidentally dealing with the pen methods.

Fig. 1 is a snapshot of a building that was once a chantry, then modified into an ordinary dwelling-house, and finally into a tea-shop. Fig. 2 is a much simplified version of it, eliminating the advertisements, two cars and a cycle. As far as my present purpose is concerned it does not matter that the hurried sketch is feeble and crude. I am not showing what can be done by the method, but am describing how to do it.

Fig. 1.

The first step is to make two prints. One may be on any sort of paper that will show all the tones and details as well as possible. The other must be on a matt surface paper, and should be as light as is consistent with showing all the outlines. Every maker of bromide papers has several grades of suitable paper for the purpose. The print should be very much over-exposed, and developed only long enough for the whole image to be faintly visible.

Even a matt photographic paper does not take either ink or pencil as well as ordinary drawing-papers and boards. It has a sort of "greasiness." I have found it a help to treat the surface with pumice powder, which any chemist can supply.

Pin the dry print on to a drawing-board, and rub the whole surface very thoroughly with a plug of cotton-wool dipped at intervals in the pumice powder. The treatment makes no visible difference. Dust the surface with clean wool. Now with a pencil, H or HB, draw lightly the main outlines and details of the subject, just sufficient to serve as a guide in making the drawing later.

The next step is to get rid of the photograph. I formerly used a solution of copper sulphate and common salt, but it was difficult to get rid of the image altogether, especially if the operations were carried out by daylight. I now have a perfectly efficient method.

Make a solution of ½ oz. of potassium iodide in 10 oz. of water, and dissolve in this enough metallic iodine to give a ruby port colour to it. Iodine flakes are rather expensive, but a friendly chemist will weigh out a quarter of an ounce, which will last a long time. The solution can be used over and over again.

Pour it over the print, and rock the dish. The result is alarming. The silver image becomes a dirty brown, and the paper a deep indigo blue.

Fig. 2.

Rinse the paper once or twice, and pour over a little hypo solution as for fixing prints. In a moment or two there is the sheet of paper with nothing on it but the faint pencil marks, except perhaps a lemon yellow tint where the darkest tones were. This is iodide of silver, which disappears as fixing is continued. Wash the "print," pin it up to dry, and then mount it.

With the guidance of the other print you can then proceed to finish your drawing, simply or elaborately as you please. Three pencils are generally sufficient, say H, HB and B. When you have finished, "fix" the drawing in the steam from a kettle. The gelatine of the emulsion holds the pencil surprisingly.

Even on a pale print it is impossible to see the light pencil marks which are all that should be used for plotting out the drawing. The only thing to do is to go over the subject systematically, section by section, and not jump about at random. With pen and ink the work done on the print can be seen sufficiently well.

Whether pencil or ink is used the surface of the paper should not be touched during bleaching, fixing and washing.

A pen drawing may be finished by washes in monochrome or colour, and a skilful worker can produce the effect of a coloured etching if he so desires. Unfortunately, I have so far failed completely to find any treatment that will make a bromide paper take an even wash properly, but these are seldom required.

There are several other ways in which photographs can be transformed, but those I have suggested will be enough for a start. Perhaps I may be able to refer to the matter again at some future date. W. L. F. W.

HOLIDAY SNAPS

By E. M. BARRAUD.

THE time has come for most of us when the camera surmounts a pile of things that have somehow or other simply got to be pushed into that rucksack or suitcase, and I am going to assume that you have assured yourself the instrument is in good order, and confine myself to making a suggestion that *this* year's collection of pictures shall be *different*—different, and very much better.

Learn from Last Year's Snaps.

Looking over the albums of last year's pictures, and the year before that, and so on back into history, most of us have to admit that there is something lacking, something we somehow missed; that the pictures are not typical of that particular spot we chose, that the groups of people with whom we so enjoyed ourselves might just as well have been taken, well, in the garden, or even out in the street not five yards from home or the office!

Get away from these unsatisfactory conditions this year, and bring back a really splendid record. To begin with: have you tried taking a picture of the *inside* of your holiday headquarters? The rooms where you take your holiday meals that somehow taste so much better, the room where you slept, tired out after a day's strenuous exercise in the open air—don't these deserve to be included in your record?

It is very easy to take indoor pictures with modern films, and modern cameras, even of the humbler variety. You haven't a tripod? But there is always a chair, and a book or two to get just the right angle.

You will not regret the exposures made with just that extra moment of thought and care, when you are able to add to your album one or two shots of that fascinating stairway, the doorway into your room, the corner by the window where you took your meals.

Make Typical Views.

As to views, and out-of-door pictures generally, try and make them typical, so that afterwards you will not be wondering just where that particular one was taken—it will stand out at once that it could only have been taken at Blank-on-Sea, or on the Broads (look at those rushes, that windmill, that low-swung bridge!) or on the wide expanse of Exmoor (there is even a tiny Exmoor pony in the middle distance!).

If you keep your eyes open, you will notice that every county, even every sub-division of a county, has its special charming characteristics, whether of rustic gateway, thatched cottage, peculiar style of ecclesiastical architecture, or what not. Use your eyes, and then use your camera to make a record of what they tell you.

If you can read up something about the district beforehand, you will be guided in your discoveries, and half an hour in the local reference library will be well spent, but even if this is impracticable a little intelligent observation on the spot will soon give you the clues you want, and time so spent will not be wasted when you come to display your pictures proudly during the coming winter.

Special Subjects.

And then, too, what about looking out for some particular subject? I myself, being of plebeian tastes, have a special album labelled "The Inn I Know," and into that album goes one print of every photograph I take of pleasant inns I find up and down the country (it is amazing what a warmth of friendly recognition lights the faces of those who also know my inns!). Country gates, stiles, churches, thatched cottages, and dozens of other subjects will suggest themselves to the minds of those attracted to them. A side-line of this sort forms a thread of permanent interest linking up all one's haphazard picture-making.

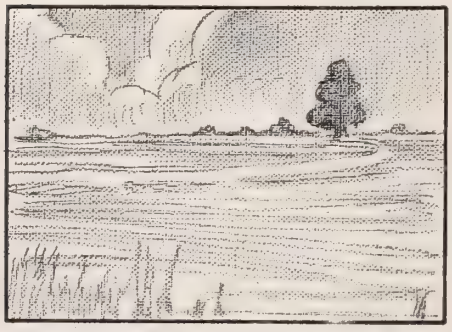
People.

Last of all, we come to people, and it is a sickening fact that other people are far more interested in pictures of fellow human beings than anything else! You may produce really excellent photographs of this or that scene, some architectural gem, some exceptional corner of the country, yet they are all liable to be put aside or, worse still, allowed to slither to the floor, while the audience pounces on some wretched snap of Mary balanced on a breakwater, or George all dressed up for the promenade.

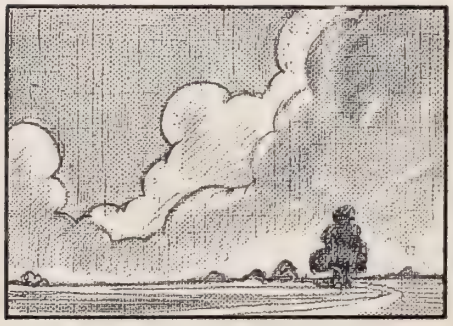
Human weakness being such, see to it that at least your pictures of people are pictures, and of people, and not something for which you have to blush as a photographer. Take your people doing something, not just glaring fixedly at the camera. Catch them in unguarded moments (but if you *must* take uncle when he is asleep, let your valour be tempered with discretion when the print comes home!). And if you are taking groups, see to it that you have more of a hold over the members of it then the inevitable funny man of the party, or something is sure to go wrong, and need to be explained away.

Bearing all these things in mind will make a difference—and I think it will be one that you will not regret.

Picture Points



No. 10 (New Series) *by RICARDO*



The Case for Clouds in Landscapes

THANKS to the improvement of films and the increasing popularity of filters, it is an easy enough matter to produce a negative that shows some sort of contrast between the white clouds and the blue sky But the opportunity that so often presents itself of photographing the clouds as the main point of interest or *motif* as a pictorial subject, is not recognised as much as it might be.

The top sketch shows a landscape that holds foreground, middle distance and distance of sorts, and a little of the clouds. If there had been some really strong interesting feature in it, this viewpoint would have been justified, but as it is, it is an insipid landscape. Should, however, the clouds be bold, of pleasing size and proportion, then the camera should be pointed upwards instead, to give a picture like that in the lower sketch, with sufficient landscape included at the base to give balance and perspective.

If the blue is very pale, a deep yellow filter will give good contrast, but unless a special effect is desired do not over-correct or emphasise the blue as the false tone value will look unnatural.

When Clouds are not Required

JUST as we have seen that clouds can make a picture out of a commonplace landscape, so can they be out of place in other landscapes—although they might even be present and appear at first sight perfectly natural. It all depends whether they compete with the main point of interest by contrast of tone, awkward contours or bad placing in the picture. Or, as in the case of the lower sketch, by being unsuited or irrelevant to the *motif*, or the main subject.

It would be difficult to try and ignore the fussy little patch of clouds in the top sketch, particularly as the contour of the building is rather intricate, and it is all rather distracting to the interesting little figure study. Cover up the clouds with the thumb and it will be agreed that the picture is improved. The attention is now allowed to rest peacefully on a peaceful subject. From the technical point of view, too, to fit a filter just to bring out that little mass is to risk under-exposure with the real subject where colour correction is not needed.

In the lower sketch, something of a similar character is shown. A simple arrangement such as this, that depends largely on the passive and gentle wisp of smoke to give it its correct atmosphere, would most certainly not be improved if some big blustering clouds were included in the background, whether they were visible at the time or printed in.

Clouds should always be in keeping with the subject.

Avoid Overcrowding the Picture, a Common Fault

IT seems that one of the biggest difficulties in the would-be pictorialist's path, is that of ruthless trimming or elimination of unnecessary subject matter in the print. The good advice of always including a little more on the negative than you intend to use is, of course, intended only for a possible change of mind regarding the final edges of the print, and also to guard against incorrect viewfinders and possible damage to the edge of the negative by finger-marks and frilling, etc. Not that we should *print* everything on the negative.

It is easy enough to understand that after including the entire negative on the enlargement it requires a superhuman will to lop off perhaps half or more of the print and reduce it to something like a contact print, just because we are told that the rest was superfluous. But generally it is so, and if the remaining diminutive portion be enlarged to a substantial size and put alongside the original "all-in" print we are better able to satisfy ourselves that "the part is often better than the whole."

This is true of almost every subject that can be photographed, and here we can illustrate only one of them. To snap the entire bush laden with blossoms because of the vivid impression it makes temporarily on our mind is not to say that when reduced to terms of mere black-and-white on flat paper it will be just as pleasing. Concentrate on, say, three blossoms and the print will be a lot easier to look at.

MORE PLAIN TRUTHS

The besetting sin of advertisers in general is overstatement. As admirers of the truth, we have always done our best to avoid falling into this common pitfall. It strikes us, moreover, as being a serious tactical error, and one which—with its unflattering estimation of the intelligence of the public to which it is addressed—is more likely than not to achieve the opposite effect to the one desired.

Bearing in mind these considerations, we can honestly say that we feel justified in making the following statement.

For the last three years we have been the only firm specialising exclusively in miniature photography. We do not think we exaggerate when we say that during that time we have become something closely akin to a world institution. Given a fair amount of energy and enthusiasm, and limiting ourselves as we have done to a single branch of photography, we really can't see how we could have helped doing otherwise.

We believe that as far as miniature cameras go we have by far the finest selection of both new and second-hand apparatus to be seen in England. As far as service goes, we place at our customers' disposition the results of our very catholic experience, both as an aid in the selection of suitable apparatus and subsequently to ensure that they secure full satisfaction from their hobby.

CONTAXES.

We very much regret that the small supplies of the Contax Model III are now completely exhausted. Further deliveries of this camera (which seems likely to be the miniature camera best-seller) are to arrive within the next few weeks. In the meanwhile we are booking orders and suggest that customers wishing to obtain a camera from the next consignment place their order without delay. The Contax Model III resembles closely in its general specification the chromium Model II, but has the addition of a built-in photo-electric exposure meter. It is thus the first miniature camera of the range-finder type to be equipped in this way. We might add that the increase in bulk is negligible. Price with f/2.8 Tessar lens, **£55 17s.**; with f/2 Sonnar, **£63**; with f/1.5 Sonnar, **£78 5s.**

THE FOLLOWING LIST REPRESENTS A SELECTION OF USED MINIATURE CAMERAS FROM OUR STOCK. WE HAVE, BESIDES THESE, THE MOST COMPREHENSIVE COLLECTION OF NEW MINIATURE CAMERAS AND ACCESSORIES TO BE FOUND IN GREAT BRITAIN. OVER FIVE HUNDRED DIFFERENT ACCESSORIES FOR THE LEICA CAMERA ONLY ARE TO BE SEEN AT OUR SHOWROOMS

WITH EACH OF THE SECOND-HAND CAMERAS LISTED BELOW WE GIVE A WRITTEN GUARANTEE OF MECHANICAL AND OPTICAL PERFECTION.

LEICAS:

Leica Model IIIa, fitted latest pattern rectilinear focussing f/1.9 Hektor. Unsoiled in any way £45 0 0
Leica Model IIIa, f/2 Summar lens, ever-ready case. As new..... £34 10 0
Leica Model III, black, f/2 Summar lens, ever-ready case. As new..... £31 10 0
Leica Model III, black, f/3.5 Elmar lens, ever-ready case. As new..... £23 17 6
Leica Model II, black, f/3.5 Elmar lens. Excellent condition..... £18 10 0
Leica Model II, black, f/2.5 Hektor lens. As new £21 10 0
Leica Model I, f/3.5 Elmar lens, interchangeable. Excellent condition..... £10 10 0
Leica Model I, f/3.5 Elmar, non-interchangeable. Good condition..... £7 18 6
Leitz f/3.5 Elmar, 3.5-cm., coupled, nickel..... £6 7 6
Leitz 5-cm. f/3.5 Elmar, coupled, nickel..... £6 7 6
Leitz 7.3-cm. f/1.9 Hektor, non-rectilinear focussing..... £18 10 0
Leitz 13.5-cm. f/4.5 Elmar, uncoupled. In good condition..... £7 5 0
18-cm. f/5.5 Tele-Megor, coupled for Leica with special finder. As new..... £18 15 0
Leitz Stereo Viewer..... £5 5 0
Leitz Copying Arm, with rotating stage plate to fit enlarger column..... £6 17 6

CONTAXES:

Contax Model I, wedge-type range-finder, f/1.5 Sonnar lens, ever-ready case. As new £42 10 0
Contax, as above, but with f/2 Sonnar lens..... £32 17 6
Contax, as above, but with f/2.8 Tessar lens..... £25 17 6
Contax, as above, but with f/3.5 Tessar lens..... £23 17 6
Contax, as above, but fitted earlier type range-finder, with f/2.8 Tessar lens.. £23 10 0
With f/3.5 ..... £21 10 0

The following Telephoto Lenses will fit either Models I or II Contax:—
Zeiss 8.5-cm. f/2 Sonnar Lens. As new..... £26 10 0
Zeiss 12-in. f/8 Tele-Tessar, with filter and special case. Cost £48. As new.. £30 0 0

Contax Plate Back, £3 5 0. Extra Slides, 5s. 6d. each. 42-mm. Filters: Dark Red, 12s. 6d.; Green, 12s. 6d.; Light Yellow, 9s. 42-mm. Proxars: No. 1, 12s. 6d., No. 2 12s. 6d. Contax Magniphot Enlarger, to take lens from camera. Excellent condition, £6 17 6.

MISCELLANEOUS:

Contaflex, f/2 Sonnar lens, ever-ready case. As new..... £55 10 0
Latest 6×6 Automatic Rolleiflex, f/3.5 Tessar lens, Rapid Compur, ever-ready case. As new £20 10 0
Latest 4×4 Automatic Rolleiflex, f/2.8 Tessar, Rapid Compur, case. As new £21 10 0
Automatic 6×6 Rolleiflex, f/3.8 Tessar, Compur, ever-ready case. Excellent condition £16 15 0
Automatic Rolleiflex 4×4, f/2.8 Tessar, normal Compur, ever-ready case..... £17 10 0
Rolleicord, f/3.8 Triotar, ever-ready case. As new..... £11 17 6
Exakta Model A, f/3.5 Ihagee anastigmat. Good condition..... £11 10 0
Exakta Model A, f/3.5 Tessar. Excellent condition..... £13 17 6

THIS HOLIDAY, TAKE SPEED SUBJECTS

WITH A

PURMA

SPEED CAMERA

Here is the camera with the type of shutter used by all Press photographers for getting the marvellous speed subjects you see in your daily papers. *Now* you can get them. Don't envy the man with an expensive camera—get a PURMA and get snapshots of everything you want. Simple to use—no focussing—everything from 6 ft. to infinity sharply defined—6 instantaneous speeds up to 1/200th second. Takes 16 pictures on vest-pocket size film for 1/-. This is just the camera you have longed for for your holiday—it widens the scope of your photography immensely for the small sum of **35/-**

Ever-ready case, 10/- extra.

British Patent 430648 and 445907. World Patents pending.

Look for the registered name PURMA on the ever-ready case.

This anent LEICA—and the WESTMINSTER

● With just one and the same LEICA Camera you can do an infinite variety of work—covering virtually the whole range of photography. That, in itself, makes for much saving of time, trouble, space, labour in carrying, and cash. Thus, for the price of your LEICA you are gaining many advantages — advantages especially typical of LEICA.

● ● By a call at "the Westminster" you can learn with pleasure all that there is to know about LEICA. At the same time you can know how (readily and economically) you can Part-Exchange your present Camera for a LEICA, settling any balance Out-of-Income—or, of course, you can buy outright on that basis.

● ● ●

This is the LEICA Model IIIa, having shutter speeds up to 1/1,000th of a second, f/2 Summar lens, and, of course, completely automatic focussing. It costs £43, or can be acquired by 9 monthly payments of £5 0 4. There are other models from £16.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Yacht Races and the Amateur Cinematographer

By F. J. M.

THE call of the sea is heard once more, and the amateur ciné worker, no less than his brother of the still camera, will find that the coast and the many activities connected with holidays at the sea will provide endless material for action subjects.

This particularly applies to sailing vessels which are to be found at practically every seaside resort and these invariably provide striking subjects for the cinematographer, particularly if he manages to get afloat himself, so that they can be shot when on the move in deep water.

Twice fortunate, however, is the ciné worker who makes his holiday centre at a part of the coast where a big yacht race is held during his visit. He then has the opportunity of securing pictorial results of one of the most beautiful subjects of the sea.

It does not necessarily follow that the finest yacht-racing pictures are secured when dealing with the biggest yachts. Just as fine sport and equally good pictures may be secured with the smaller craft as subjects, and there is much greater likelihood of getting them in groups and at close quarters.

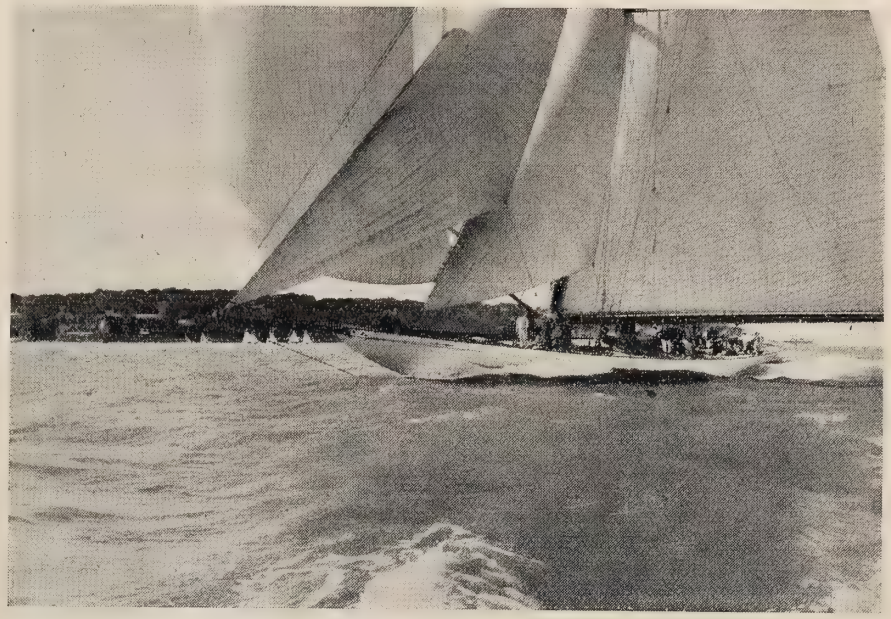
For the photographer who does not care to venture afloat, or who has not a boat available for his own use, quite good shots of the smaller racing craft can sometimes be secured from the pier heads, or even from the shore; but undoubtedly the best method of dealing with this particular subject is for the photographer to be afloat himself—preferably in a power-boat, which may be a steam launch or a motor-boat, or even a smaller boat with an auxiliary motor.

While such a boat may not permit him to keep alongside the racing vessels, it will enable him to intercept the race at various points, and to secure striking groups from time to time during the race. This is the ideal way of tackling such subjects.

During Cowes Week, which starts on August 3rd, followed by regattas at Ryde and Southsea, and other places on the coast, finer opportunities for yacht photography are presented than in any other part of the world. Here can be seen yachts of all descriptions under ideal conditions, and no amateur ciné worker can be blind to the beauty of the subject or the opportunities for making action pictures that are presented.

Many of the points that the ordinary snapshot photographer would have to observe when photographing racing yachts will not arise, or will not matter, when taking action pictures, although the question of light has to be taken into account. If the light is very strong and powerful a small stop can be used, unless a filter is employed, which is very desirable sometimes, particularly when white-sailed yachts are shot against a blue sky. The filter must then, of course, be compensated for by a larger stop.

For this reason also panchromatic stock is eminently desirable, and in addition a longer lens hood than usual should be employed as the subject is one in which there is an enormous amount of reflected light from the water.



The question of background is not so important as for the still photographer, who is advised to keep clear of heavy coastlines beyond the yachts. In action films this will not affect the picture, in fact it may add to the stereoscopic effect.

The same applies to the massing of a number of moving yachts. The still photographer is urged to get his yacht isolated, or if there are several, in a pleasing group. With the ciné the more the merrier, and complicated groups in a number of different planes—constantly changing—add to the liveliness of the scene.

One point, however, must be stressed when photographing a race. Although it may be taken from a motor-boat travelling at the same rate as the yacht, the yacht should be allowed to come into the field of view and pass across and right out to be most effective. This can be done by allowing the motor-boat to become practically stationary, or by slow panning. Do not, however, keep coming back to the same yacht entering the picture from either the right or the left. This becomes very irritating when seen later.

Close-ups are very effective, as also are yachts racing across the field of view in the eye of the sun. The silhouetted forms of the sails and the sparkle of the water produce most beautiful effects when seen on the screen, provided the lens hood has been effective.

When in search of pictorial groups of racing yachts, whether small or large,

Shaking out the Spinnaker. This is a good angle from which to take a big racing yacht. She should be followed right through until she has passed.

the photographer should make for definite points in a race, such as the starting-point or one of the mark-buoys round which the yachts have to turn during the course of the race. It frequently happens that a number of yachts will reach the mark-buoy together and this makes a notable shot as they turn and get on the other tack.

Another point to bear in mind when photographing a yacht race is to endeavour to get to the lee side of the boats—that is to say the side which shows the deck and crew when the boat is heeling over with the wind. This always gives a better idea of action.

As mentioned above, close-ups are very effective and some of the finest yacht shots can be obtained when the boat is literally almost on top of the photographer. Care must be taken, of course, neither to be run down nor to hamper the progress of the yacht by getting in the way. For this reason a reliable man, familiar with "the rules of the road" should be in charge of the motor-boat while the cinematographer is operating. If, also, it is possible to get a trip on a big yacht during a race some wonderful deck shots with the crew at work will add to the charm of the complete film.

Finally, note at intervals that the lens is free from spray or blurred results will be obtained.

"Up Anchor." Some of the most attractive shots of yachts are to be obtained as close-ups. This particularly applies when the yacht is racing under full sail, but do not get too close, or it may be dangerous both for you and for the yacht.

ACTION SUBJECTS for the AMATEUR CINEMATOGRAPHER

The new

WESTON METER

FOR THE NOVICE.—So skilfully designed is this new Weston Meter that the merest novice can use it and get successful exposures straight away. Set the dial to correspond with the film speed, point the Weston to the subject, set the arrow to the scale reading, and read the desired shutter speed and stop—that's all ! No calculations or complications.

FOR THE EXPERT.—Provision is made for an analytical study of the scene. Simple markings on the calculating dial enable the correct exposure for either the brightest object or the darkest object to be measured. Thus, certainty of success takes the place of costly experiment.

The Weston Meter possesses an unequalled degree of quality and permanence. Buy a Weston Meter **once** for correct exposures **always.**

A Prize Competition for Novices

THIS competition is specially for those readers of "The A.P." who are Novices; that is to say, amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups, or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

Our readers who are Novices have all the summer in which to make their prints for this competition, and the prizes are worth having.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.
The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.
The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.
Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 30th. This will give new readers who are Novices, and who intend entering this competition, every opportunity of improving their work during the next two months by reading *The Amateur Photographer* every week and obtaining their competition prints during the summer holidays.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices" Competition.

Further reference to the competition will be made week by week, and hints given for the best treatment of various subjects for Novices.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. They are printed in either the vertical or horizontal form as shown here, and each is complete in itself.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 × 3, supplied for card index cabinets.

The collection when completed will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index, and are now ready. The size of the box is $5\frac{1}{2} \times 3\frac{1}{2} \times 3$ and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, S.E.1. Price 2s. 6d.

20 SELF-TONING PAPER

SELF-TONING papers provide a convenient and easy method of making contact prints when daylight is available. The paper, which is supplied in standard cut sizes, is simply placed in contact with the negative in a printing frame and exposed to bright daylight, but not to direct sunlight.

Progress is ascertained from time to time by opening the back of the printing frame in subdued light and examining the paper. Printing should be carried much farther than desired in the finished print. With some makes of paper it is necessary to continue printing until the shadows become "bronzed."

As the name indicates, "self-toning" papers have the toning chemicals incorporated in the emulsion, and need fixing only in a plain hypo solution to produce the finished result. Greater permanency is secured by washing the prints in plain water for five minutes before fixing them, but the maker's instructions, that are supplied with the paper, should be followed in this matter.

A rich sepia colour is obtained by immersing the prints in the following fixing bath:

Hypo	..	..	4 oz. (200 gms.)
Water	..	..	20 oz. (1,000 c.c.)

An acid-hypo fixing bath should never be used for self-toning papers.

If the maker's instructions say that the print should not be washed before fixing, a few grains of bicarbonate of soda should be added to the fixing bath.

If the prints are soaked for about five minutes in the following salt bath instead of washing, a colder purple colour is produced:

Common salt	..	..	2 oz. (100 gms.)
Water	..	..	20 oz. (1,000 c.c.)

Prints should be rinsed in water after this salt bath and then fixed in the hypo bath as above.

Use fresh solutions for each small batch of prints and keep them moving in the baths or uneven patches may result. After fixing, wash thoroughly for half an hour.

Two-colour effects can be obtained on self-toning paper by applying the salt solution given above with a camel-hair or sable brush to certain portions only of the dry print, and then fixing. Parts that are so treated will be colder in tone than the remainder of the picture. This is a very effective method for portraits.

21 DEPTH OF FIELD

IN order to calculate the depth of field that will be in sharp focus for any lens and the aperture in use, it is necessary, first of all, to find the hyperfocal distance (H.D.) of the lens, which automatically takes into account the lens stop in use, the focal length of the lens and the sharpness of definition desired. The method of calculating the hyperfocal distance is fully described in No. 13 of this series.

This depth of focus formula is used for calculating the nearest and the farthest point of any subject that will be in sharp focus when the lens is focussed on a known distance between these two points, the distance between them being known as the depth of field.

Nearest Point in Focus =

$$\frac{\text{H.D.} \times \text{Focussed Distance of Lens.}}{\text{H.D.} + \text{Focussed Distance of Lens.}}$$

Farthest Point in Focus=

$$\frac{\text{H.D.} \times \text{Focussed Distance of Lens.}}{\text{H.D.} - \text{Focussed Distance of Lens.}}$$

EXAMPLE.—What is the nearest and farthest point in sharp focus of a 6-in. focal length of lens working on f/9, which is focussed on a point 10 yards away? (The hyperfocal distance of this lens and aperture is 22 yards.)

$$\text{N.P.} = \frac{22 \times 10}{22 + 10} = 7 \text{ yards (approx.)}$$

$$\text{F.P.} = \frac{22 \times 10}{22 - 10} = 18 \text{ yards (approx.)}$$

The depth of field is 18 − 7 yards = 11 yards.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Naturalistic Photography.

Can you give me an idea of the scope of the book "Naturalistic Photography," referred to in the obituary notice of Dr. P. H. Emerson?

H. R. (London.)

The book was first published in 1890, but although several subsequent editions appeared your only chance will be to obtain a second-hand copy, which should not be difficult. The work is full of useful hints, the main idea of the theme being to render subjects as the eyes see them rather than as the lens records them.

Diapositive.

What is the meaning of the term diapositive?

E. E. R. (Newhaven.)

The prefix means "through." A diapositive is a transparency viewed by transmitted light, that is, the light passing through it. A lantern slide is a familiar example. An ordinary positive (a "kata-positive"), such as a print on paper, is viewed by reflected light.

Lens Hoods.

In the usual way I use a lens hood that is half cut away and I always turn the top portion in the direction of the sun. I am told that it is not the most efficient type, especially where water is included in the photograph. Is this so and why?

A. B. T. (London.)

Although this type of lens hood is quite satisfactory for general work, it is certainly not the most efficient, especially where more than one source of light is to be seen. Should the sun be reflected on the water somewhere near the field of view, or even on metal parts below the lens on the baseboard of the camera, it follows that these reflections, being almost as strong as the sun itself, need just as much protection, and a lens hood of the type you describe is insufficient. A complete round tube lined with black velvet or painted matt black is more efficient and does not require adjusting to suit the angle of lighting.

Stop Bath for Slides.

What is a reliable stop bath for lantern plates, to be used in the same way as for gaslight prints?

E. S. (Fulham.)

Here is a formula:—

Water	.. ..	5 oz.
Sodium sulphite	.. ..	1 oz.
Sulphuric acid	.. ..	20 min.

Give not more than one minute in this, rinse quickly, and transfer to fixing bath.

Scratch Marks on Negatives.

Can you please explain what is causing the scratch marks on some of the enclosed negatives? As you see, it does not occur on all of them.

J. C. (Oldham.)

If the films were all on one spool and a folding camera was used, the most likely explanation is that after the exposure was made the bellows were closed and the camera shut before the film was wound on to the next number. In this way the bellows were pressing tight against the sensitive emulsion and caused long straight scratches as the film was moved along. Get into the habit of winding on the film immediately the exposure has been made. This method also helps to prevent double exposures.

Focal-plane Shutters.

Working with a photo-electric meter, I find that with a Compur shutter camera my exposures are near enough correct, but when I use the stated speeds on my reflex camera, the exposures are always over-exposed. What allowance should I make?

D. O. M. (Canada.)

Although the focal-plane shutter is more efficient in several ways than a between-lens shutter, there should be no difference as far as time of exposure is concerned if both are correctly calculated and tabulated. It often happens that the focal-plane shutter slows up, due to wear, etc., causing over-exposure. The remedy then is to make a few test exposures alongside the Compur shutter camera, using identical negative emulsions. Speed up the focal-plane shutter until the exposure is about the same as with one of the Compur speeds and then note the disparity of the stated speeds. Although this difference might not hold good for all the speeds on the focal-plane, it will at least offer some idea of the varying shutter speeds.

High Temperatures.

I am shortly going on a Mediterranean cruise and am wondering what effect the hot weather will have on the roll films before and after exposure, all of which I propose to develop after I arrive home. Are there any other precautions to take?

G. M. L. (Eastbourne.)

If each roll film is rolled up carefully in its original silver paper and repacked in its carton, you will find that, provided the films are stored in a dry place, the hot weather will not have any adverse effect on them, and in this way they will keep for many weeks. Some makers provide, at a slight extra cost, specially sealed metal cartons for protection against all tropical conditions. If there is a professional photographer on board, it is a good plan to have one film developed to check up on exposures, efficiency of camera and bellows, under the very strong lighting conditions. Examine the lens from time to time as the sea spray leaves a fine deposit of brine, which, if left to accumulate, will mar the definition of the lens. An efficient lens hood is almost essential under such conditions.

Depth of Definition.

Which would give the greater depth of definition, an f/1.9 lens stopped down to f/4.5, or an f/4.5 lens used at its full aperture? Both being, of course, of the same focal-length.

E. A. C (Bucks.)

Other things being equal, such as type and correction of lens, etc., lenses of the same focal length at f/4.5 give the same depth of definition, irrespective of whether they have a larger aperture or not.

Album Paper.

Is it possible that some photographic albums are made of chemically impure paper, as I have noticed that even if prints are thoroughly washed, they tend to fade and stain in some albums?

R. D. (Hindhead.)

If you get an album from a reliable photographic dealer we do not think you need be anxious on the score of the quality of the paper. If your prints fade, as you say, we should think it unlikely that it is due to the paper of the album. You speak of thorough washing, but you must not forget that thorough fixing is, if anything, still more important.

Copying Rough Surfaces.

Is there any way of eliminating the rough surface of a photograph when copying it?

H. J. (India.)

It is very difficult to avoid showing grain when copying from a very rough paper. The chief precaution is to have light falling on the paper exactly from the front with an equal diffused light all round, and this is rather difficult to manage. You might try coating the print with a mixture of equal parts of glycerine and water, and squeegeeing it in contact with a sheet of clear glass while copying. The print can afterwards be washed and dried, without showing any ill effects.

"The A.P." Monthly Competitions

PRIZES AND RULES.

To encourage pictorial outlook and good technique in the photographic work of our readers in all parts of the world.

(I) For Advanced Workers.

This class is open to all amateur photographers.

FIRST PRIZE.—One guinea in cash or "A.P." silver plaque (optional).

SECOND PRIZE.—Half a guinea in cash or "A.P." bronze plaque (optional).

THIRD PRIZE.—Five shillings in cash.

A special prize of five shillings in cash for the best mounted picture.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply :—

(1) All prints must be accompanied by a stamped addressed envelope or wrapper if they are to be returned. Prints receiving an award will be retained.

(2) Prints must be mounted, but not framed.

(3) Returnable prints in the Advanced Section will be sent back with a typed criticism, and classified according to merit.

(4) Prints may be of any size and by any process, and must be the competitor's own work throughout.

(5) The award of a prize or certificate in the Advanced Workers' Competition or any other competition or exhibition will not debar the competitor from entering again on future occasions and winning further prizes.

(II) For Intermediate Workers.

This class is to encourage those readers who have passed the "beginner" stage and may have won an award in the Beginners' Competition, but have not progressed sufficiently to enter in the Advanced Competition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply :—

(1) No print must be larger than 10×8 in., and can be by contact or enlargement by any process, and may be mounted.

(2) The whole of the work (exposure, development, printing, etc.) must be carried out by the competitor.

(3) Prints entered in the Intermediate Section will be criticised and returned if accompanied by stamped addressed envelope or wrapper. Prints receiving an award will be retained.

(4) The award of a prize or certificate in the Intermediate Competition debars the competitor from entering this competition again, but he is then eligible for the Advanced Workers' Section.

(III) For Beginners.

This class is open to those who have never won an award in any photographic competition or exhibition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply :—

(1) No print must be larger than 6×4 in. Contact prints or small enlargements up to this size are eligible, but must be unmounted.

(2) The exposure must have been made by the competitor, but developing and printing may be the work of others.

(3) No prints can be criticised or returned.

(4) The award of a prize or certificate in the Beginners' Competition debars the competitor from entering this section again.

General Rules.

(1) Any number of prints may be entered, but each print must have on the back the appropriate coupon (see advertisement pages) the date of which must be within five weeks of the closing date of the competition. Overseas readers may use the most recent coupons to hand.

(2) Each print must have on the back the name and address of the competitor, and the title.

(3) All entries must be addressed to The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the package must be marked on the outside "Beginners," "Intermediate," or "Advanced," as the case may be.

(4) No packages will be received on which there are postage charges to be paid.

(5) No communications on other matters should be enclosed with competition prints. No correspondence in connection with the competitions can be undertaken.

(6) The entry of a print will be regarded as a declaration that it is eligible under the rules, and that the competitor agrees thereto.

(7) No responsibility is taken for the safety of prints, and the Editor's decision on all points connected with the competitions is final.

(8) The publishers of *The Amateur Photographer* shall have the right to reproduce, without payment, any print entered, or to allow its reproduction in any other paper quoting from *The Amateur Photographer*.

(9) The closing date of each competition is the last weekday of the month. Prints arriving late will be entered for the next month's competition.

(10) The cash prizes awarded in these competitions are dispatched on the fifteenth of the month following the announcement of the awards.

The closing date for the July competition is Friday, July 31st, and for the August competition, Monday, August 31st.

The London Salon of Photography 1936.

SENDING-IN DAY, Wednesday, September 2nd.

THE TWENTY-SEVENTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at the Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 12th September, to 10th October, 1936.

CONDITIONS OF ENTRY.

(Please read carefully.)

1. Pictures must not be framed; but may be mounted or unmounted. Each picture must bear on the back clearly written (a) name of artist; (b) number and title of picture, corresponding to particulars on the Entry Form.
2. When mounts are used they should conform to the following sizes—25×20, 20×16, or 15×12; but no mount to exceed 25×20; and it is suggested that white or light-toned mounts be employed. Prints may be of any shape or size, provided they do not exceed the limits of the mounts as given above.
3. All packages of exhibits from abroad must be clearly marked on the outside: "PHOTOGRAPHS FOR EXHIBITION ONLY—NO COMMERCIAL VALUE—TO BE RETURNED TO SENDER." No prices to be marked on the prints.
4. Pictures sent unmounted will be suitably mounted by the Salon Committee and all accepted pictures will be shown under glass.
5. Pictures must be sent by post or parcels post, packed flat and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.
6. All pictures for the exhibition must arrive at the above address *on or before* Wednesday, September 2nd. Entries may be delivered by hand at the Gallery on that date only.
7. The Entry Form for pictures from abroad must be sent SEPARATELY by post, together with entry and packing fee of 5s. (this fee covers any number of pictures from one exhibitor). Exhibitors residing in the British Isles may enclose Entry Form and fees with their pictures.
8. Pictures sent by post will be repacked in the original wrappings and returned, carriage paid, after the close of the exhibition.
9. As applications are made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify in the space provided on the Entry Form, whether they have objection to such permission being given. The copyright in all cases remains the property of the authors of the prints.
10. The Committee assure intending exhibitors that the greatest care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.

If pictures are sold a Commission of 15% is payable to the Salon.

The submission of pictures will be understood to imply acceptance of the above conditions.

Notification of acceptance of pictures will be sent out as soon as possible.

A Catalogue will be sent to each exhibitor.

Entry Forms and further particulars from the Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS :

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue : 13 consecutive insertions, 5% ; 26 consecutive, 10% ; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry ; Guildhall Buildings, Navigation Street, Birmingham, 2 ; 260, Deansgate, Manchester, 3 ; 26B, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

CAMERAS AND LENSES

CAMERAS Exchanged and Bought ; largest stock in S. London ; all materials ; Pathescope agents ; special attention.—Humphrys, established 1840, 269/273, Rye Lane, London, S.E.15. [2472

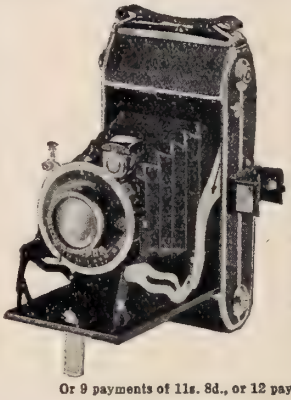
MENTORETT Latest 6×6 cm. Twin-lens Reflex, pair f/3.5, coupled iris, fully automatic, de luxe leather case ; perfect condition, £16/16.—45, Newington Butts, S.E. 11. (Rodney 3773.) [0037

£2 Contessa Roll Film, f/6.3 anastigmat ; perfect throughout.—12, Biddestone Rd., N.7. [4353

ZEISS Tessar f/3.5 Kolibri, Compur, 16-on-V.P., Proxar, yellow filter, case, Baby Miraphot Enlarger, £15.—Garnon, Fairview Rd., Chigwell, Essex. [4355

SUPER Ikonta 2¼×4¼ or half, Tessar f/4.5, case, filter, hood ; unsoiled ; Ombrux meter, £15 ; seen N.W.1.—Box 8692, c/o "The Amateur Photographer." [4356

FOTH-DERBY 3×4, f/3.5, filters, case, £3/10.—D. Rhodes, Grange House, Allerton, Bradford. [4358



MULTI-SPEED Exakta, Zeiss Tessar f/3.5, recently overhauled by maker, square case and E.R. case, both leather, filter and light hood ; all perfect, £15/10.—Pearce, 94, Doveleys Rd., Salford, 6. [4359

LEICA for Sale.—Thistlethwaite, 1, South Row, Blackheath, S.E.3. [4361

ROLLEICORD, 1935, Zeiss Triotar f/4.5, case, lens hood ; perfect condition ; nearest offer to £9 by Friday secures ; deposit system.—Box 8740, c/o "The Amateur Photographer." [4364

A VERY Real Bargain for Serious Photographers.—Thornton-Pickard Duplex Reflex, latest model, fitted Dallmeyer f/2.9 Pentac and Cooke 12-in. f/5.5 Teleros, Stevens' focussing screen, magnifiers in case, lens hood, flexible release, four 3-in. Wratten filters and holder, 3 D.D. slides, roll-film holder ; cost considerably over £60 ; accept £26/10.—Major Longfield, at Ashdene, Elburton, S. Devon. [4365

A New NORFOLK

ROLL-FILM MODEL

3¼×2¼ (with masks also for 2¼×1¾).
There has frequently been a demand for a roll-film camera of good design with a fast lens at a price below £5, and here is the model to fit that demand. Self-erecting model, well designed, 2 finders, including one direct-vision clear glass type, fitted to side of camera with neat mask on hinge for half-picture size. Fitted with f/3.8 Zeranar lens and Prontor II shutter, 8 speeds, 1 to 1/150th sec., and delayed action

£4 : 19 : 6

Or 9 payments of 11s. 8d., or 12 payments of 8s. 9d.

VOIGTLANDER BRILLIANT

This is the ideal camera for both beginner and the amateur who wants something better than just an ordinary roll-film camera. Ideal for action pictures and particularly the taking of children.

Voigtlander Brilliant Miniature Reflex gives brilliant image full size of picture right up to moment of exposure. 12 pictures 2¼ in. square on 3¼×2¼ standard film. Dimensions only 4⅞×3⅞×3¼ in. Weight 19 oz.

With f/7.7 Voigtar lens, 2 speeds, 1/25th, 1/50th and B.
Or 9 payments of 5s. 6d. **£2 : 5 : 0**

Voigtar f/6.3 lens, 3-speed shutter, 1/25th, 1/50th, 1/100th sec., B. and T., delayed-action device..... **£3 : 15 : 0**
Or 9 payments of 8s. 11d.

Skopar f/4.5, Compur shutter, 1 to 1/300th sec., B. and T.
Or 9 payments of 13s. 5d., or 12 of 10s. 1d. **£5 : 15 : 0**

With Compur Rapid shutter, 1 to 1/500th sec..... **£6 : 15 : 0**
9 payments of 15s. 9d., or 12 of 11s. 10d.

Just a few really good used Bargains in guaranteed condition, subject to approval.

V.P. Piccochic Roll Film, with f/2.9 Vidanar lens, Compur shutter **£3 15 0**

Foth-Derby (16-on-V.P.), f/2.5 Foth anastigmat lens, special Rhaco finder..... **£5 5 0**

Kodak Duo Six-20 (16-on-120 film), with f/4.5 Kodak lens, Pronto D.A. shutter **£4 15 0**

Zeiss Ikon Super Ikonta Model I, No. 530, with Zeiss Tessar f/3.5 lens, Compur Rapid shutter, with speeds to 1/500th, colour filter, lens hood and leather case..... **£14 19 6**

Leica Model I, latest type, interchangeable lens model, f/3.5 Elmar lens. New condition, only had two films through the camera **£11 19 6**

Model V Victor Cine Camera, turret head, visual focussing and wind back, f/1.5 Dallmeyer Speed anastigmat lens, also 2-in. f/2.9 triple anastigmat lens, in Mortimer leather case with filter. Cost £60 18s. As new..... **£44 0 0**
Without 2-in. lens..... **£39 0 0**

Victor Model III (non-turret type), f/1.5 Dallmeyer anastigmat lens **£15 15 0**

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer." The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged ; over £10 and under £50, 2/6 ; over £50 and under £75, 5/- ; over £75 and under £100, 7/6 ; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed **& Co.**

Notes being untraceable if lost in transit should not be sent as remittances.

IMPORTANT NOTICE

Owing to the August Bank Holiday, the next issue of "THE AMATEUR PHOTOGRAPHER" (dated August 5th) must be closed for press earlier than usual.

In accordance with the notice that appeared last week, the latest date upon which MISCELLANEOUS ADVERTISEMENTS could be accepted for the above issue was

WEDNESDAY, JULY 29th.

CAMERAS AND LENSES

ROLLEIFLEX Auto. 6×6, Tessar f/3.8, green filter, lens hood, leather case hold camera and accessories ; as new, £16, or nearest offer quick sale.—Craig, The Laurels, Milngavie, Glasgow. [4366

ENSIGN

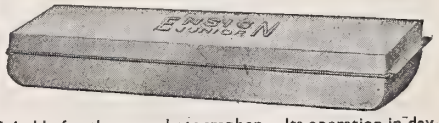
DEVELOPING TANKS

DAYLIGHT SUPER CARBINE TANK

The new high-speed films now in use call for a new technique in developing. They cannot be developed even in a safely lighted dark-room—they have to be developed in total darkness. With the Carbine Tank you load and develop the film, in the tank, **in broad daylight.**

Fitted with paper extractor which separates the paper entirely from the film and ensures efficient development.

No. 20, for size 20 films only

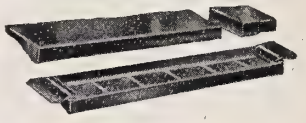


27/6

DAYLIGHT CARBINE TANK

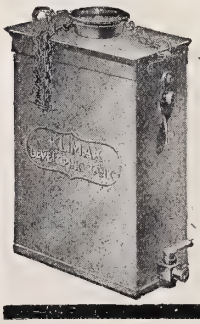
Similar to the Super Tank but without paper extractor. Every operation in full daylight with absolute simplicity.

	Tank
No. 1 for size 27 films.....	**15/-**
No. 2 „ 20 „	**21/-**



JUNIOR DAYLIGHT DEVELOPING DISH

Suitable for the new photographer. Its operation in daylight being remarkably simple and easy. Metal throughout, with aluminium finish outside and special anti-sulphuric coating on the inside.



For Size "20" 2¼×3¼ roll films..... **7/6**

MINIATURE DEVELOPING DISH
For Ensign Midget and short length of Leica and similar film.

Development with this dish must be carried out in a dark-room with the aid of a Ruby lamp. The midget film is placed into the dish, which is filled with developer and after the daylight cover has been placed in position the work may be finished in the daylight.

Dish only, **1/9** With cover, **2/9**

KLIMAX TANK
FOR PLATES

All operations (except loading) can be carried out in daylight. Six plates may be developed at one time. Brass throughout, with exceptionally fine nickel-plating.

3¼×2½ **18/6** 4¼×3¼ **20/-**

OF ALL PHOTOGRAPHIC DEALERS.

DUNSCOMBE'S
"PERSONAL" CAMERA COLUMN
'SERVICE SUPREME'

ELMAR ACOOS

CHAPTER II.

In the glorious summer of 1936, or to be more accurate, Monday, June 29th, a celebrated personality, none other than Mayor Itchin from Chortle-cum-Hardy, visited Messrs. Dunscombe's Emporium and was formally introduced to friend Elmar.

It appears that the Mayor, who, incidentally, was accompanied by the Town Clerk and nearly all his corporation, was anxious to obtain the services of our Elmar, and this was very quickly arranged by the Mayor agreeing to pay only 2s. 6d. down, and a like amount on the first Friday in each month for a period of ninety years, with the option of outright purchase at the end of this period. In fairness to the ratepayers of Chortle-cum-Hardy, it is only right to say that the transaction would not affect the rates for the next quarter of a century by more than an increase of seven-eighths of a penny per population and the cancellation of the dustmen's annual day out to Southend.

Before proceeding to accompany the civic dignitary to his home town, Elmar insisted upon being equipped with a full length of the new Eastman Super X 35 mm. Film, which was loaded ready for use at the price of only 1s. 6d., which is, of course, ridiculously cheap considering the number of pictures which can be taken on 5 ft. 3 in. of film.

It was rather a sad farewell for Elmar, who, during his brief stay in Bristol had seen many enthusiastic miniature camera users, and as a result had come in contact with many of his near and distant relations, and the parting between Elmar and Miss Telyt Toolp was most pathetic, but as they have promised to meet again very soon it is only the old slogan of "Absence makes the heart grow fonder." So, with a clashing of cymbals and the beating of drums the mayoral procession departed from Bristol in the midst of a terrific cloudburst, which necessitated a perilous journey through the streets in canoes, punts and large bath-tubs, which rather spoilt an otherwise perfect summer afternoon.

A postcard was received three days later stating that Elmar had reached his destination, and *en route* had captured some extraordinarily good photographs depicting scenes of the deluge which will for all time serve as a pictorial record, not only of the memorable occasion of Mayor Itchin's hire purchase transaction, but also of the great Bristol floods.

The reason why the pictures taken by Elmar were such an outstanding success was due entirely to the skill and careful attention which Messrs. Dunscombe's give to the developing, printing and enlarging of all miniature films, of which they make a speciality at the usual standard prices.

Next week we shall have pleasure in presenting to our readers extracts from Elmar Acoos diary, commenced from the time he arrived at Chortle-cum-Hardy.

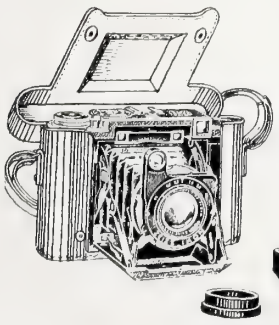
WHERE MINIATURISTS FARE BEST!



LEICA QUICK-WIND ATTACHMENT

This marvellous new accessory is coming shortly. We shall have first supplies as usual. Book your order now. This accessory will fit any Leica Model.

It would be a real eye-opener to you if you could call at our fine new showroooms at 127, New Bond Street, and see how well equipped we are to deal with the needs of the miniature camera user. Our stocks are the largest and most varied in the country. We give free expert advice on any photographic query, and are the only firm in existence who insures your miniature camera free of charge—it doesn't matter where you bought it, as long as it cost £10 or more.

Extract from a recent testimonial—typical of hundreds we keep getting.

The AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

3D

The Journal for Everybody with a Camera

Vol. LXXXII. Wednesday, August 5th, 1936. No. 2491.

A Rolleiflex Picture

For unusual holiday pictures—no matter what conditions—against the light, against any odds, Rolleiflex will get them. It's a vital help to see your picture full size, right way up on the ground-glass screen, and **know** that it will appear **exactly** the same on the negative. Think of the film you thus save by avoiding bad shots. Rolleiflex is easily manipulated—there's no need to take your eye from the subject while photographing. The Zeiss Tessar f/3.5 lens and Compur shutter speeded to 1/500th sec., T. and B., will tackle any photographic subject. Rolleiflex takes 12 pictures on 3¼×2¼ 8-exposure roll film for a shilling. Make it **your** holiday camera. **£25.**

Ask your dealer to demonstrate, or write for illustrated prospectus and name of nearest stockist to Sole Importers :

The new

WESTON METER

LOWER LIGHT VALUES.—With its greatly increased sensitivity, the new Weston Meter ensures absolutely accurate exposure for almost every shot—indoors or out—artificial light or poor daylight—colour or black-and-white.

SIMPLER TO USE.—Readings are obtained by simply pointing your meter to the subject to be photographed.

SLIMMER and more pocketable—little bigger than a box of Swan Vestas, it can be kept in the pocket—handy.

The Universal Meter for Still and Cine Cameras is simple for the novice and is yet designed to cover the most comprehensive needs of the experienced. The Leica Meter is designed for simplicity especially for the Leica.

Weston was the first photo-electric cell meter introduced—and in this new meter is embodied over five years' manufacturing experience—the result is a degree of quality and permanence not possible with meters having less knowledge and experience behind them.

2 MODELS

Leica Meter especially for Leica Cameras.

Universal for all Still and Ciné Cameras.

WALLACE HEATON COMPETITION

FOR USERS OF 35-mm. STILL CAMERAS

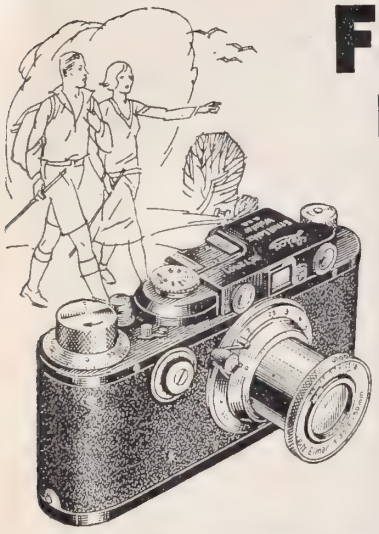
for the best photograph submitted during the run of the competition
£25
will be awarded

This Competition is open from now until September 30th. Your photographs can be of any subject—but they must be taken on 35-mm. film. Prints should not be smaller than 6×4 inches.

Any number of prints can be sent in in any one week, but each photograph must have the coupon attached. In addition to the big prize, a weekly prize of £1 1s. will be awarded for the best photograph submitted in that week.

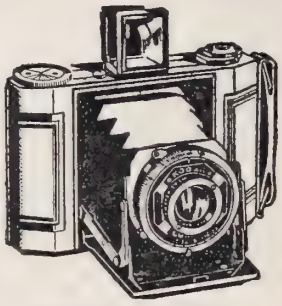
Each photograph must have on the back a coupon as below, and the name and address of the sender, the make of camera and material used, exposure, etc.

For photographs which appeal to us, not necessarily prize-winners, we reserve the right to purchase the copyright by payment of £2 2s.; in the case of weekly prize-winners by the payment of an extra 21/-. The copyright of the £25 prize-winning print must be made over to us without further payment. *In addition we are offering a special prize of £1 1s. per month for the best photograph submitted depicting a person or persons using a camera purchased from Wallace Heaton Ltd. All prints will be judged at the end of the Competition for the final prize of £25 cash. Acceptance of these rules and conditions is a specific condition of entry.*



USERS OF LEICA, CONTAX, CONTAFLEX, RETINA, ROLLEIFLEX, and ROLLEICORD (if used with ciné film) can all compete.

ADDRESS YOUR ENTRIES TO "COMPETITION," **(Phone : Mayfair 7511—8 lines.)**



COUPON which must be attached to your entry. **WALLACE HEATON** 35-mm. Film Competition. August 5th, 1936.

AND AMPLE SUPPLIES OF FILMS, INCLUDING THE NEW "KODACHROME" CINÉ FILM!

EXCHANGE (1929) LTD.

The New SIMPLICITY and Certainty

with which correct exposure can be ascertained with the New "Avo" Exposure Meter has won enthusiastic praise from professional and amateur photographers alike. It is the simplest and most dependable meter ever made. The quickest to use. A boon to all photographers, saving time, materials and opportunities.

MR. OLIVER G. PIKE, F.Z.S., F.R.P.S., M.B.O.U., *writes, "My film, 'Nursery Island,' owes the excellence of its exposures to your 'Avo' Meter .... My 'Avo' told me the right stop every time, and I cannot speak too highly of it."*

- Unique method of exposure indication.
- Extreme sensitivity. Gives exposures from 60 secs. to 1/2,000th of a sec.
- Fits vest pocket. Size only $2\frac{1}{2} \times 2\frac{1}{8} \times 1$ in.
- Influenced solely by light received from normal picture angle.
- Can be held and operated in one hand without removal from leather case.

This anent LEICA—and the WESTMINSTER

With just one and the same LEICA Camera you can do an infinite variety of work—covering virtually the whole range of photography. That, in itself, makes for much saving of time, trouble, space, labour in carrying, and cash. Thus, for the price of your LEICA you are gaining many advantages—advantages especially typical of LEICA.

By a call at "the Westminster" you can learn with pleasure all that there is to know about LEICA. At the same time you can know how (readily and economically) you can Part-Exchange your present Camera for a LEICA, settling any balance Out-of-Income—or, of course, you can buy outright on that basis.

This is the LEICA Model IIIa, having shutter speeds up to 1/1,000th of a second, f/2 Summar lens, and, of course, completely automatic focussing. It costs £43, or can be acquired by 9 monthly payments of £5 0 4. There are other models from £16.

THIRD EDITION

REVISED THROUGHOUT

PHOTOGRAPHY MADE EASY

By R. CHILD BAYLEY
Author of "The Complete Photographer," "Hand Cameras," "Photographic Enlarging"

AS EASY AS A · B · C

This is a book for photographic beginners, and, if carefully studied, it will enable the novice with a camera to get a greater proportion of successful photographs than would usually be the case.

"Photography Made Easy" should be read by everyone taking up photography: it should form as much a part of the outfit as the camera itself: it is an ideal present to give an amateur photographer.

THE POPULARITY of PLATES

The widespread popularity which plates enjoy is founded on no mere preference but on definite advantages. Plates are the chosen sensitive media of the vast majority of professional photographers and advanced amateurs. Carried in single metal slides they offer all the benefits of individual handling and processing, combined with complete protection for the longest journey.

R. BASSETT-BULLOCK, M.C., A.R.P.S., writing in *The British Journal of Photography*, says :—

"They can be carried for days by car, if need be, without suffering any harm. I pack mine five dozen at a time in a leather case, which usually contains six packets of Ilford S.G. Pans, three packets of Ilford S.R. Pans, three packets of Ilford Hypersensitive Pans, and three packets of Ilford Auto-Filter, ..."

Select your plates from the ILFORD *range*

ILFORD AUTO-FILTER
H. & D. 400—Gives correct renderings of yellows and greens without a filter. A useful plate of ample speed for hand camera work, gives good rendering of skies.

ILFORD SPECIAL RAPID PANCHROMATIC
H. & D. 400 — A plate of steeper gradation than the S.G. Panchromatic having great latitude and giving colour correct renderings.

ILFORD SOFT GRADATION PANCHROMATIC
H. & D. 700 — Plates of exceptional colour sensitivity with high speed soft gradation and full colour sensitiveness with reliability in the darkroom.

ILFORD HYPERSENSITIVE PANCHROMATIC
H. & D. 2500 to Daylight. Splendid for fast work under dull conditions and for instantaneous photography by artificial light.

VOL. LXXXII. No. 2491.

Topics of the Week

A FINAL reminder is given to readers who are proposing to send prints, lantern slides and ciné films to the Annual Exhibition of the Royal Photographic Society. The last day for submitting entries is Friday, August 14th. The sections are: 1—Pictorial Photography, 2—Colour Photography, 3—Natural History and Technical Photography, 4—Cinematography. Standard sizes for mounts are 20×16 in. and 16×12 in., in Sections 1, 2 and 3. The entry form, which must be properly filled up with all details and marked for the section in which the prints, etc. are entered, must not be enclosed with the entries, but posted under separate cover. No prices must be marked on the prints or entry forms. Address entry forms and packets to The Secretary, The Royal Photographic Society, 35, Russell Square, London, W.C.1.

The latest day for entries for the London Salon of Photography is Wednesday, September 2nd.

Taking Photographic Apparatus into the U.S.A.

In addition to the information given in "The A.P." Summer Number" (July 22nd), regarding the admittance of apparatus and materials into the principal European countries when taken by visitors on holiday, we have now the particulars (kindly supplied by the British Department of Overseas Trade) that apply to the United States of America. The U.S.A. Customs authorities have ruled that "moving picture and other cameras and films imported for the personal use of the importer and not for a commercial purpose would be entitled to free entry under the United States Tariff Act of 1930. There is no specific limitation as to the length or number of films that may be imported in the baggage of a non-resident tourist without payment of duty for the personal use of the importer, and a reasonable quantity, depending on the circumstances of each individual case, would be allowed." Our readers should make a note of this information and file it with that given in our previous note.

THE FISHERMAN'S ASSISTANTS.

A seaside snapshot with pictorial possibilities.
See article on "Seaside Snapshots that are Different."

An Anti-Miniaturist.

We recently listened to a verbal outbreak by the editor of one of the well-known shilling weekly journals, one that devotes considerable space to reproductions of topical news photographs. He spoke at length on the subject of miniature cameras—and his language was lurid and to the point. He denounced the modern miniature as a curse in the matter of good photography for the press, and said that the press photographers who had "gone miniature" were turning out prints (or enlargements) of such badness and graininess that on some occasions they were not fit to reproduce. He admitted that the amateur and serious worker who gave time and thought to the careful development of miniature negatives could, and did, produce fine-grain results that compared favourably with the best work made with bigger cameras, but unfortunately these people were not producing the news prints he wanted. The "rush" methods of the press photographer were not conducive to perfection when miniature negatives were made on roll film. It is well to note, however, that most of this editor's remarks were directed towards foreign press photographers—who have had plenty of opportunities lately for "red-hot" news pictures, and had in most cases made them with miniature cameras.

He thanked goodness (or words to that effect) that the majority of the Fleet Street men still stuck to their quarter-plate or 9×12 cm. Press cameras and used plates that gave decent negatives fit for enlarging! What do our miniature workers have to say to that?

Sir Henry Wellcome.

The world of scientific research and enterprise is poorer by the death of Sir Henry Wellcome. He was probably best known to photographers as one of the founders of the well-known firm of Burroughs Wellcome & Co., of "Tabloid" fame, but this side of his work represented but a small part of his many and far-reaching activities. Born eighty-two years ago in Wisconsin, U.S.A., he became a naturalised British subject in 1910, and was created a knight in recognition of his manifold and munificent services to research in medicine and its allied sciences. His life story might fittingly be called a romance of science and business. The firm of Burroughs Wellcome was founded in London in 1880, and, besides the chief works at Dartford, now has works, offices and warehouses in most of the great centres of commercial activity throughout the world. In addition to the development of applied science as carried on in the laboratories at the Wellcome Chemical Works, he established a series of research institutes and museums. These include The Wellcome Physiological Research Laboratories in London, The Bureau of Scientific Research and The Museum of Medical Science, The Entomological Field Laboratories and The Wellcome Research Institution in Euston Road. He established The Wellcome Tropical Research Laboratories, Khartoum, The Medical Hospital Dispensary at Mengo in Uganda, The Lady Stanley Maternity Hospital, and has equipped many archæological research expeditions besides contributing generously to an endless number of other medical and scientific enterprises.

"The Amateur Photographer" EXPOSURE TABLE—*August*

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The subjects will be varied to suit the time of year. The following exposures will serve as a working guide for any fine day during the month, between the hours of 10 in the morning and 2 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured, or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 8 to 10 a.m. or from 2 to 4 p.m. double these exposures. From 6 to 8 a.m. or from 4 to 6 p.m., treble them. From 5 to 6 a.m. or 6 to 8 p.m., about four times these exposures will be required.

N.B.—The times given above are by "sun time." The exposures, therefore, which are laid down as suitable for 2 to 4 p.m., for instance, will be those to be given between 3 and 5 p.m., by the clock, during "summer time."

Subject.	Ordinary.	Medium.	Rapid.	Extra Rapid.	Ultra Rapid.
Open seascapes and cloud studies	1/30 sec.	1/45 sec.	1/90 sec.	1/120 sec.	1/150 sec.
Open landscapes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes ..	1/18 ,,	1/30 ,,	1/50 ,,	1/70 ,,	1/90 ,,
Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes	1/10 ,,	1/15 ,,	1/30 ,,	1/40 ,,	1/50 ,,
Landscapes in fog or mist, or with strong foreground, well-lighted street scenes ..	1/8 ,,	1/12 ,,	1/25 ,,	1/30 ,,	1/40 ,,
Buildings or trees occupying greater portion of pictures, river scenes with heavy foliage	1/4 ,,	1/6 ,,	1/10 ,,	1/15 ,,	1/20 ,,
Portraits or groups taken out of doors, not too much shut in by buildings.. ..	1 ,,	2/3 ,,	1/3 ,,	1/4 ,,	1/5 ,,
Portraits in well-lighted room, light surroundings, big window, white reflector ..	4 secs.	3 secs.	1½ ,,	1 ,,	3/4 ,,

As a further guide we append a list of some of the best-known makes of plates and films on the market. They have been divided into groups, which approximately indicate the speeds referred to above. The hypersensitive panchromatic plates and films require less exposure than the ultra-rapid.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

What Film shall I use?

The number of films constantly increases, and there are great differences between them. These are very important for the photographer who uses a small modern camera, in view of the necessarily exact nature of his negative-making. Some of the differences and how to make the most of them are referred to in the following article.

IN the not very distant past, when the amateur photographer was provided with only two or three films by as many makers, there were little differences to be detected between them, either in the matter of speed, or the type of negative produced.

To-day the number of films has increased considerably, and they differ in speed, in their colour rendering qualities, and in the manner in which they behave in the developer. Some develop rapidly, and easily give too much contrast for the condenserless enlarger to cope with, others develop more slowly, and there is a difficulty in getting sufficient vigour.

These are very important matters, and the user of the small or miniature camera, who is concerned with the production of negatives intended for enlargement, must take note of these differences, while any advantage that a particular film may offer may be turned to account to suit any particular subject or method of working.

The "Best" Film.

In former days photographers of experience were often asked which was the "best" plate. The same question is asked, but the word "film" is substituted for the word plate. The answer in the former case was that there were no important differences on the score of quality, since all the products of the best makers were good.

Differences existed, but in minor respects—speed of development, the type of image produced, tendency to fog, etc. The "best" plate for general work was the one with which the photographer had gained some familiarity in the use of, provided, of course, that the subject was not one that demanded certain characteristics, as is the case with high-speed work, copying, etc.

In the same way the "best" film is the one with which the photographer has had experience, and has found successful in his work. Some photographers have a tendency to expose fully, which means that a negative will have greater contrast with the same time of development, than one which, while not underexposed, has had just enough light action to give a thin, delicate image.

Panchromatic Films.

The greatest differences are evident when the panchromatic films by the different makers are compared. In one or two cases the slight over-exposure results in a dense negative with the contrasts so flattened that it is almost impossible to get a satisfactory enlargement. In such cases a shorter time of development is called for.

Other makers' panchromatic films will produce negatives of the "soft gradation" type, under the same conditions. These differences should be noted in relation to the photographers' working methods, by all who are concerned with the making of small negatives and large prints.

The various "fine-grain" panchromatic films also exhibit distinct differences. These seem to have a wider range of exposure latitude, and provided that the exposure is not excessive, give softly brilliant negatives that are ideal for the enlarging process. This also depends upon the photographer. Full exposure needs a shorter time of development, and especially in the case of subjects that have strong contrasts.

These matters must exercise the mind of the photographer who does his own finishing. Presumably, the D. and P. firms have their own methods of dealing with miniature films of different manufacture.

Other Differences.

Apart from speed, colour sensitiveness, in various degrees, and whether the emulsion produces a soft or a contrasty negative, there are other differences to be considered.

Some films tend to curl more easily than others, and this means that the photographer must be careful in order to avoid risk of scratching the negatives.

Backing.

Many of the modern films are coated with a backing on the celluloid side, red, green or brown, with a view to preventing halation. When the films are developed in a tank the effect of this backing with regard to the protecting paper has to be thought of. In some cases the backing and the paper stick together, and the result is that the negative has a series of markings that are difficult to remove.

The use of a tank that leaves the paper outside, or one which is loaded in the dark-room, avoids this trouble.

In most cases this backing compound dissolves out in the developer, or in the acid fixing bath that most makers recommend, and the final washing should leave the negatives free from any coloration. This is not always the case, and there are several films on the market that produce negatives of a greenish colour. This is of no importance, as long as it is uniform, but if the coloration is irregular it should be removed by a weak solution of ammonia after the washing, followed by another short wash.

What Film?

The answer to the question, "What film shall I use?" will depend largely on the subjects for which the film is being employed. For the average snapshotter at the seaside, for instance, practically any film may be used, as even the ordinary type has definite orthochromatic qualities, and is of good speed, while the 'chrome types have these qualities even more marked and have higher speeds. The miniature camera worker at the seaside should definitely use "fine-grain" film, while the more ambitious worker who is anxious to secure better tonal qualities and clouds should use panchromatic film and a filter to suit it.

With MOTOR CYCLE and a Camera

By "WANDERLUST," of "The Motor Cycle."

The Top of the Hill.

ANY really serious photographer who uses costly, and possibly fairly bulky, apparatus will invariably tell you that the worst thing you can do to your camera is to take it with you when you go motor cycling.

I have just spent several months touring over the most impossible "roads," by motor cycle, in my search for spots unknown to the average camera user. I have discovered several things which may help amateur photographers wishing to visit hitherto inaccessible spots by this method of transport.

During the first week I carried about an old, but sound, half-plate stand camera. This, together with a convertible lens, a set of colour filters, and the usual stand camera accessories, made me think that there would be no photograph that I would have to say "No" to. This apparatus I stowed into a pannier bag, strapped to the side of the machine.

Every time I wanted to take a photograph I had to spend at least a quarter of an hour getting ready, but after four days of using the stand camera, I wrapped up the lens in a soft duster, as usual, and did a fairly quick journey home, a distance of about sixty miles. When I examined the camera again I found that the lens had wormed its way out of the duster and had ground itself to bits against a metal strut; several of the loose screws had worked right out, and the front lens panel was about as vertical as the Leaning Tower of Pisa.

As I had to get the rest of the photographs in a hurry, the only thing to do, I thought, was to take my Press camera and risk smashing that also.

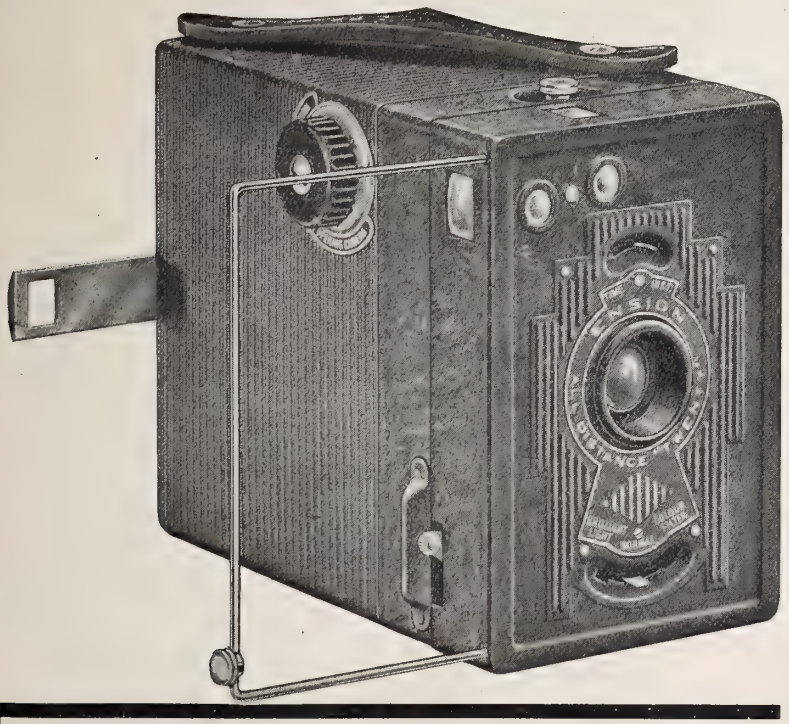
* * *

I have been using this camera ever since (it is a T.-P. All-Weather Press camera with an f/3.5 lens), and, although I have been hundreds of miles at varying speeds, with the camera over my shoulders, it is as sound as ever. Also the weight of my camera has been practically unnoticeable.

The charm of the stand camera, I had imagined, would be in its versatility. Only once, though, had I reason to use any of its gadgets, and on that occasion it was almost unnecessary.

Now my accessories consist of a folding tripod, which, being rarely used, can be strapped securely to the machine, an Ilford Delta gelatine filter placed between the lens—I can leave it there more or less permanently, and it does not cause loss of time when adjusting the stop, etc.—and Ilford Soft Gradation Panchromatic plates, with a Verichrome film pack; the latter I keep only as a reserve in the event of my running out of plates when a good way from the town.

I would most certainly never take a photograph without a filter. Panchromatic plates, I find, hardly seem much advantage over the ordinary type unless a filter is used. For ninety per cent of my pictures I use a Delta filter, which increases the time of exposure four times, but gives delightful cloud renderings, and slightly over-correct results.



There is much to be said about advantages of the miniature camera, but when it comes to 100 per cent first-class results, suitable for enlarging and press work, there is nothing to beat a bigger camera. With a miniature camera wonderful results can be obtained sometimes, but on very difficult subjects, say, with excessive contrast, the larger-size cameras hold the field, especially for ease of handling in the dark-room.

Regarding the motor cycles. Modern machines can go almost anywhere, and provided you are not the type of person who revels in tinkering every moment, are almost as clean as a push-bike, but certainly do the job better.

But, whatever you do, carry your camera on your person!

An English Beauty Spot.

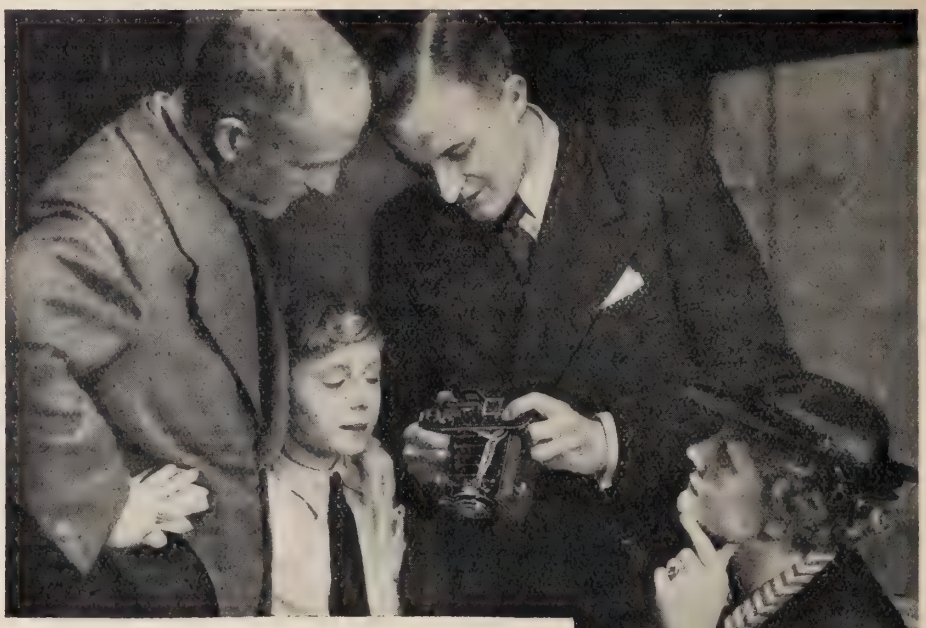
Better Pictures with a Box Camera!

ALL-DISTANCE ENSIGN

THE BOX CAMERA WITH BUILT-IN COLOUR FILTER.

An exceptional box camera which will give you pictures of real pictorial merit, full of gradation and with tones correctly rendered. The secret lies in the built-in colour filter. It captures the clouds, too.

Simple to use, it is the ideal general purpose camera for a beginner because it gives results of such beautiful quality. The patent "All-Distance" lens gives pinpoint definition from 3 ft. to infinity. Positive one-way time and instantaneous shutter. Stops for ordinary or bright light. Easy loading. Upright and horizontal finders, also direct-vision finder.



Marvellous value !

ENSIGN, Limited,
HIGH HOLBORN,
LONDON, W.C.1

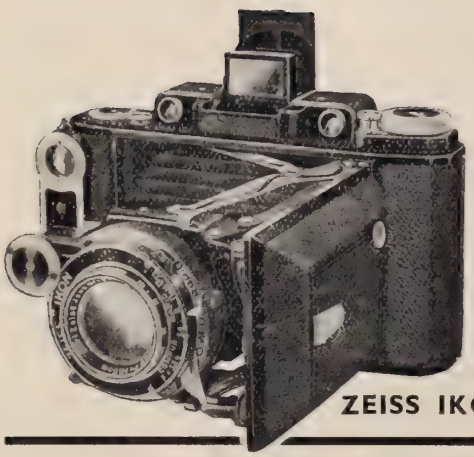
PRICE 15/-

IMPORTANT

All Zeiss Ikon Cameras sold by us in Great Britain are equipped with distance and depth-of-focus scales in English feet. Also diaphragm scales are engraved according to the R.P.S. standard.

"THE shutter release won't work!"

"That's because you haven't wound on the film."



"H'm . . . . So you can't make an unintentional double exposure. Quite a bright idea."

"That's so. The interlocking arrangement in the Super Ikonta II sees to that. This red signal by the release shows that the film has been wound on."

"I see. It turns red when you wind on the film, and goes back to white when you have taken the picture."

"Yes, you can't spoil a film by exposing it twice. And the rotating wedge distance meter coupled with the lens does away with that other bugbear—the difficulty of focussing correctly."

ZEISS IKON

THE Super Ikonta II for $3\frac{1}{4} \times 2\frac{1}{4}$ pictures provides one with quite a large-size picture while retaining many of the advantages found usually only in miniature cameras—interlocking device preventing unintentional double exposures, built-in rotating wedge distance meter, chromium-plated fittings, rapid Zeiss Tessar f/3.8, Compur Rapid shutter to 1/400th second, and shutter release located on camera body.

Those desirous of further particulars are invited to ask their local dealer for a demonstration. Name of nearest stockist, together with full particulars, free on request. 96-page general catalogue for 3d. in stamps.

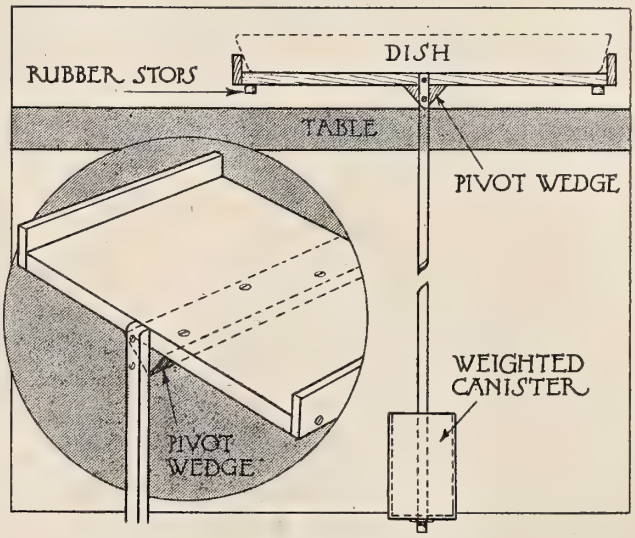
SUPER IKONTA II

ZEISS IKON LTD., 11, Mortimer House, Mortimer Street, London, W.1

Readers' Hints, Tips and Gadgets

A PENDULUM DISH-ROCKER.

THE accessory illustrated is a real help in the workroom, as it will keep a dish of developer or fixer rocking for some time and thus save the operator a tedious job which is often not thoroughly carried out.



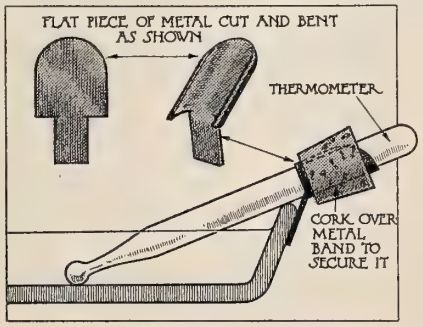
A piece of wood, about ¾ in. thick, is cut approximately to size to carry the dish, and a narrow strip is fixed to each end to prevent any chance of the dish slipping. At each end a small rubber stop can be secured which not only prevents the dish from jarring but helps to keep the pendulum swinging longer.

Transversely across the middle a stout strip of wood, which serves as the pivot, planed to a sharp edge, is screwed. (Or strip metal can be used with advantage if available.) A dowel, or thin curtain rod, 2 to 3 ft. long (the longer the better), is screwed to the edge of the dish platform and at right angles to it as shown in the sketch.

A tin canister, such as a coffee tin, is then punched top and bottom with holes just large enough to fit the dowel rod, and held in place by a nail through the rod. This canister is filled with lead, cement or small stones.

The fitting is placed on a table with the pendulum hanging over the side, and the dish of solution put on the platform. A gentle push will cause the apparatus to rock the dish and flow the solution evenly and constantly over the plate or print for nearly a minute.

D. E. LUMB STREET.



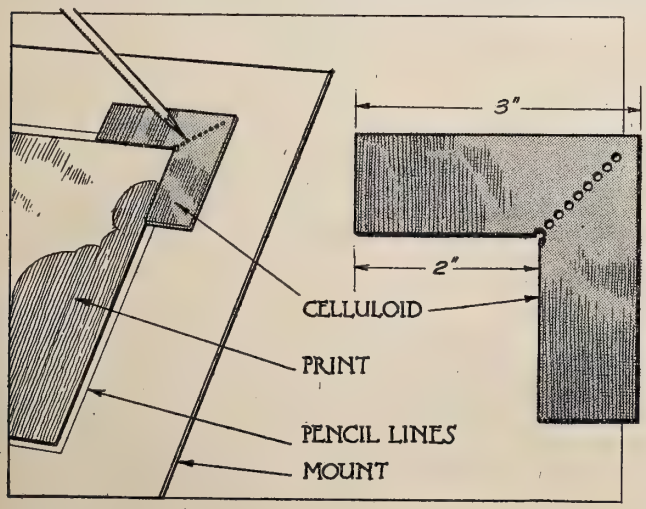
A NON-SLIPPING THERMOMETER.

THE persistent and annoying habit which most thermometers have, when left, of slipping bodily into the dish of solution can be readily overcome with the aid of the simple but effective device described here.

It consists of a piece of metal cut to a "T" shape, as shown in the illustration, the upper part of which is bent to one side to an angle of about 45 degrees.

The top part of the "T" should then be bent into a circular form so as to fit half-way round the thermometer.

A cork is then bored, preferably with the aid of a red-hot steel knitting needle, and made so that it fits the barrel of the thermometer rather loosely.



The small metal piece when slipped over the thermometer will not grip tight enough. It can, however, be held in place by slipping the cork down and over the metal piece around the thermometer. The top part of the metal band is curved so that the cork will slide easily over.

The projecting metal portion will rest against the outside of the dish when the thermometer is in use, and this is sufficient to prevent its slipping into the solution.

This device also prevents the thermometer from rolling off the shelf or table when not in use. L. G. HONE.

A USEFUL GAUGE FOR MOUNT BORDERS.

MOUNTED photographs, especially enlargements, are often improved by a line drawn on the mount at an even distance from the edge of the print. Measuring that distance accurately and evenly has always been the difficulty, as any unevenness necessitating erasure means an ugly mark on the mount. This gadget quite simply gets over the double difficulty of evenly spacing and ruling, and can be made easily by anyone.

Carefully rule a piece of stout celluloid to form a right angle, with the outer sides 3 or 4 in. in length and the inner sides about 1½ in. less. Cut accurately to shape, and drill small holes, about 1/16th in. diameter, at intervals of 3/16ths in. along a line joining the inner and outer angles.

For use, place the inner angle of the gauge against one corner of the print, and with a sharp-pointed pencil make a dot on the mount through one of the holes. Repeat at the other three corners, using the same hole, and join the four dots on the mount with either ink or pencil lines according to the type of print. The gauge could be made of thin metal, but I find celluloid is cleaner and is quite suitable. The measurements are not arbitrary, and can be varied if considered advisable.

This same idea can be adapted for measuring off the four sides of the mount and requires only the corner piece to be made larger, about 6 in. instead of 3 in. GEO. LASCELLES.

SEASIDE that

By FRANK HADDON.

When the bathing tent went west.

THE lure of the seaside for the amateur photographer is in the sunshine and brightness, the cheerful atmosphere, the bathers, the sparkling sea, the boats and the holiday feeling—all factors favourable to the making of innumerable snapshots. Yet how many of the thousands of seaside photographs that are taken every holiday season possess originality or evidence of thought. A comparison of holiday snaps by A at Brighton, B at Scarborough, and C at Blackpool, will show a curious similarity. Save for an occasional landmark to identify them they might have all been taken by X at Margate.

After the family group, the bathing girl generally takes first place—either just going in, or just splashing out, or sitting on the sands, or standing on a rock and waving to the photographer. Yet there are endless other incidents overlooked by the holiday-maker with a camera that, even if treated as snapshots, hold possibilities for novel pictures.

The illustrations herewith are merely a few of the different incidents that have been seen and snapped during a short seaside holiday. Several have their elements of originality of treatment and are put forward as lines of thought to be followed by others, not necessarily copied.

Looking up at you.

Oblivion.

Take the shipwrecked bathing tent, for instance. Every item concerning it had pictorial possibilities—all better than the usual bathing picture. Its erection on the beach, its occupants peeping out, and its final swamping by a too adventurous wave, provided material for half a dozen good snapshots.

The amateur photographer arriving at his pitch on the beach or sands for a pleasant morning or afternoon—broken into only by a bathe—is apt at first to take things very easily. He is not to be blamed—he is on holiday. After a day or

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Snapshots are Different

The Medicine Ball.

two, however, when the novelty has worn off, he should pull himself together and look around for subjects out of the ordinary—that is if he really wants to make pictures at all.

He will be surprised, if he sets about it with real intention, at the wealth of material that presents itself on every side. This particularly applies to the unexpected incidents that occur at all hours of the day.

For this reason, if for no other, the camera should always be ready for immediate use. Many of the subjects must be shot on the spot, and without delay, or the opportunity will be lost and may never present itself again.

The new Speed-way.

At the same time, the keen worker, if an incident happens that suggests a good picture, should not hesitate to try and stage something similar, provided models and environment are available.

Such shots as "Looking up at you" and "The Medicine Ball" can be tried several times until they are just right.

The former print suggests a further series of high viewpoint shots that will become more varied the more frequently they are sought. Views from the pier looking nearly straight down on to the sands or beach below provide an endless kaleidoscope of shifting groups seen at a novel angle, while the ever-changing waves breaking in on to the shore or around the end of the pier itself, seen from the same standpoint, will be vastly different and far more original in pictorial treatment than when taken from the beach level.

"What do you want?"

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

A new society has just been formed at Solihull, Birmingham. It will be known as the Solihull Photographic Society, and already has a membership of twenty-five. The annual subscription is 10s. 6d. and meetings will be held on the second Wednesday of each month at 8 p.m. in the Women's Institute, Warwick Road, Solihull. The first lecture meeting will be held on August 12th. The Hon. Secretary is David P. H. Jewsburg, at 42, George Road, Solihull, Birmingham. All interested photographers in the neighbourhood should communicate with him at that address."

We have been asked by one of our advertisers to publish the following request: "Will the client who received an Ensign Autorange, Zeiss Tessar f/3.8, D.A. Compur, in error, please return to Edwin Gorse, 86, Accrington Road, Blackburn, also the client who received a new Zeiss filter in error please return to above firm at once."

The new Agfa 2¼ × 3¼ roll-film camera, the "Speedex Record," will appeal to readers who want a serviceable pocket camera that is simple to use yet retaining all the refinements seen in more expensive instruments. It is fitted with an f/4.5 anastigmat lens with front lens focussing from 3 ft. to infinity. The Prontor II shutter has eight instantaneous speeds, from one second upwards to 1/150th sec., as well as "brief" and "time." Both the shutter speeds and stops are fitted with dual indicators so that they can also be set while looking downwards on the camera. A delayed-action device is fitted giving a time lapse of about twelve seconds. Of the self-erecting type, the front does not jump immediately into position but requires a gentle pull to lock it, when the front becomes extremely rigid. A sliding spring cover to the red window is a novel and practical feature The camera back catch underneath the handle is fitted with a dual release so that accidental openings will be next to impossible. The spool loading is simple, and a flat picture is assured by a generous spring film flattener. It is remarkably well made and strong, yet it is compact and easy to slip into the pocket. It is manufactured and distributed by Messrs. Agfa, Ltd., 1-4, Lawrence Street, London, W.C.2, and costs £5 5s. An excellent outfit for all classes of amateur photographer.

Stolen Cameras. The following is a list of cameras stolen recently from The City Sale and Exchange, 84, Aldersgate Street: Model II Chromium Leica 191235, f/3.5 Elmar 203149; f/3.5 Elmar Wide-angle 222453; Baldini, f/2.9 Trioplan 659796; Vertus, f/3.5 Skopar 838466; 12-in. Teleros f/5.5 129421; Retina, f/3.5 Xenar 704952; 6/20 Kodak Cameras, 74843, 78089, 98302, 106198, 104088, 106999, 105724; 45/107 Stereo Reitzschel Camera, f/6.8; Ross Compound Homocentric Lenses, Compur shutter 103426; 45/107 Stereoscopic Camera, f/6.8 Stylor 29823; 5/20 16-on Ikonta 70462, f/3.5 Tessar 1682209; five Supream 3¼ × 2¼ Cameras, f/4.5 Trioplan lenses, 705018, 705022, 706062, 612146, 624524; 4/3 Foth-Derby, f/3.5 42580. Any information that will assist in tracing these cameras should be sent to the above address.

We have been informed by the E. S. S. Colour Filter Company that after July 29th the whole of their business will be transacted from their new laboratory at Roughwood, when their address will be E. S. S. Colour Filter Company, Roughwood, Chalfont St. Giles, Bucks. Telephone, Chalfont St. Giles 139.

We learn with regret of the death of Mr. Will Day at the age of sixty-three. He will be well known to all interested in cinematography for his pioneer work in dealing with the historical side of the subject, and for his energy in collecting data, apparatus and materials connected with the cinema from the earliest times; his collection was exhibited at the Royal Photographic Society. His work in connection with the Lumière 40th Anniversary of Cinematography at the Polytechnic will also be remembered. He was an able lecturer and a great enthusiast who will be missed.

An error occurred in an advertisement of The Camera Co. in last week's issue. It was stated that the firm offered "Hire purchase over 12, 18 or 24 months, only 5s. per annum extra." This should read "only 5 per cent per annum extra."

Readers who use the Coronet Midget cameras should note that a 50-guinea snapshot competition for photographs taken with this camera has been announced. The first prize is 25 guineas cash. Particulars and entry forms will be sent free on application to the Coronet Camera Co., 310, Summer Lane, Birmingham, 19.

What is believed to be the only authentic portrait photograph of Lobengula, last King of the Matabele, has come into the possession of the Government Archivist in Southern Rhodesia. The authenticity of the photograph is beyond doubt, and its discovery is a matter of some surprise, since Lobengula's objection to being photographed was well known and was possibly based on fear of the evil eye. It is understood that the photograph will be on view at the Empire Exhibition at Johannesburg this autumn.

The latest winner of the Wallace Heaton Competition is Mr. S. H. Osborne, 69, St. Paul's Close, Hounslow, Middlesex, to whom an award of 21s. has been made. Full particulars of this competition appear in our advertisement pages.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, August 5th.

● Whatever your requirements may be, you can always be sure of having them met, promptly and favourably, at any of "the Four WESTMINSTERS" . . . . . Noted for EXCHANGE and EXTENDED PAYMENT Facilities.

THE ENSIGN "MULTEX"

THE ALL-BRITISH PRECISION MINIATURE. 14 pictures 1¼×1¼ on staniard V.P. film.

Coupled range-finder down to 21 in. Automatic film wind, rendering double exposures impossible. Self-capping focal-plane shutter, 1 to 1/500th sec. and Time. Optical direct-vision finder. Body of non-corrosive metal, with neatly rounded ends. Covered in fine-grain leather.

F/3.5 Ensar anastigmat ..... **£16 : 16 : 0**
Nine monthly payments of 39/4.

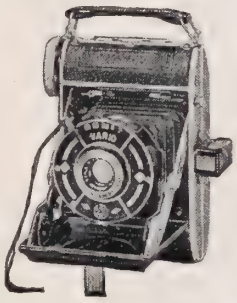
F/2.9 Ross Xpres anastigmat ..... **£21 : 10 : 0**
Nine monthly payments of 50/2.

F/1.9 Ross Xpres anastigmat ..... **£27 : 10 : 0**
Nine monthly payments of 63/2.

F/2.8 Zeiss Tessar anastigmat ..... **£26 : 10 : 0**
Nine monthly payments of 61/10

Ever-ready Case for above..... £1 1 0

● ● Now IN STOCK...The New MAGAZINE CINÉ-KODAK
Acme of Ciné Cameras



Charger loaded in 50-ft. 16-mm. film in 3 secs. Film instantly interchangeable, e.g., Kodacolor to black-and-white, and vice versa, without any loss of footage. F/1.9 Kodak anastigmat, option of four telephotos 2 to 6 in., universal finder. Ask for full description, or call and see.

Complete in leather case ..... **£40 : 0 : 0**

Nine monthly payments of 93s. 4d.

● Typical WESTEX Value!

THE "WESTEX MINIATURE"

A most efficient high-precision camera at a marvellously low price. 16 pictures 4 × 3 cm. on standard V.P. spool. Splendid results, easy manipulation. Quick, self-erecting front, f/4.5 Vidanar anastigmat lens, focussing down to 3 ft., Vario shutter, 1/25th, 1/50th, 1/100th sec., T. and B. Direct-vision optical finder. Beautifully made, very compact, slips easily into your pocket.

Price (as above)..... **£3 : 12 : 6**

Nine monthly payments of 8s. 7d.

With Radionar f/2.9 anastigmat and Prontor shutter, 1 to 1/175th sec., T. and B..... **£5 : 12 : 6**

Nine monthly payments of 13/2.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXLV.

Mr. ALBERT H. PINFIELD

From information communicated to our Special Representative.

"THERE is no doubt that most of those who aspire to serious photography have visions of that elusive thing, the exhibition print. It requires a technique and a vision, not easily gained, to obtain access to the major exhibitions of to-day. It is certainly of no use to be able to perceive wonderful compositions without a knowledge which can control the very excellent emulsions which are now obtainable.

"It would be very difficult to say just where composition begins and technique ends. For many years my own progress with both was slow. I studied theory by reading the journals; but I was working alone, and to put theory into practice as a lone worker is too difficult. The real help I have had from the Handsworth Photographic Society cannot be overrated. The discussions on processes and pictorial expression have made all its members keen on both the art and technique of our hobby. Yet while discussing these fine points we still retain our individuality.

"The materials which are placed in our hands by the manufacturers are so uniformly good that we are solely to blame if our results fall short of our pictorial desires. Yet one wonders why so many prints do not reach the high standard which can be obtained on the papers for almost any of the various processes.

"I invariably use panchromatic material for my negatives, desensitising, and using a combination of time-and-temperature and visual development, realising that there is one variable element, the contrast of the subject, which can only be controlled in this way. I use filters in conjunction with panchromatic film, according to subject requirement, usually the 'Alpha' for landscape work. I do not think we are yet prepared to accept the full correction of dark blue skies, and this filter gives an excellent compromise. As the control of our results commences with the exposure we should visualise the finished picture and start on its interpretation through all the processes.

"It is an excellent thing to get a perfect negative, but this is only a means to an end. We have to express ourselves in the print, and only the best we can do is good enough. I like to get a negative which will give me a print of good quality on chloro-bromide paper. This process is fashionable to-day, and at its best the results can be very beautiful.

"The print is developed by factor, using an M.Q. developer which can be adjusted according to the contrast of the negative to give the best colour with the required range of tones. I finally oil the print and darken any area with pigment when advantage may be gained by so doing. Recently, I have been interested in bromoil, using bromoil paper and orthodox methods.

"While I cannot say that I specialise in any particular subject I have always delighted in landscape work. Realising that this is perhaps the most difficult branch, as it is least under the control of the photographer, yet I have visions of the perfect picture which one day will come my way.

"Many of my pictures have been taken on Society outings. It is then often possible to get models who are in sympathy with the work to assist by making a foreground subject for some little nook or corner of the countryside. Many delightful compositions may be secured in this way."

(A further example of Mr. Pinfield's work is reproduced on one of the centre Art pages.)

DOWN ON THE FARM. *Albert H. Pinfield.*

Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"HILL-TOP," *by Bertram Page.*

BESIDES a very attractive rendering of an effect of sunshine, this picture is also remarkable for its feeling of air and space, while the figures themselves lend a charm of the most engaging quality and provide a literary content of considerable appeal.

Much of the beauty of the effect rests upon the way the figures are shown against the sky. The sunlight on their limbs and features, as well as on their garments, gives them a brighter tone than that of the sky behind, which, while according with the visual impression, is but seldom recorded photographically, chiefly owing to the facts that there is a sort of reluctance to utilise the very essential fully colour-sensitive material with an appropriate light filter, and that a nice degree of judgment is required in calculating both the time of development of the negative and the choice of a suitable printing paper.

Ordinary types of sensitive material are so much more affected by blue and ultra-violet than light of any other colour that they fail to differentiate between white and blue, so that, in a case like this, the distinctions of tone between the figures and their dress in sunlight and the blue of the sky would, as a rule, either be lost or only faintly indicated. The introduction of a light filter, with such emulsions, is scarcely feasible owing to the considerable increase in the exposure time required, and, though there might be some little improvement in the rendering, it would scarcely approach that which a plate or film of the panchromatic variety so readily affords, provided, of course, it is suitably screened and given the correct technical treatment.

These conditions being satisfied, a tonal scheme of this or an equivalent nature can be reproduced with certainty, and effects of sunlight, which depend for their attraction on a contrast of light tones against a darker sky, can easily be retained.

That the slight extra trouble which these emulsions need is well worth while is convincingly demonstrated by this example. The fine character of the effect is entirely dependent upon the true transmission of the tone values, and to this, also, is to be attributed the admirable feeling of air and space. The æsthetic attraction on these grounds is extraordinarily high, but a contributing factor of no little importance is the well designed arrangement of the composition.

This assumes a pyramidal formation, of which the base consists of a line drawn through the respective feet of the two figures, the left-hand side running from a point near the edge to the head of the standing girl, and the right running down from thence through the upper outline of the bicycles to a point outside the right-hand margin—as indicated by the dotted lines of the sketch. The formation, as will be seen, is one that conveys a considerable impression of strength, and it has the effect of lending a great accentuation to the standing figure (1) because her head occurs at its apex. On this account, and also because of her strength of position, she becomes the dominant element of the group and the centre of interest.

She also acquires a certain priority in view of her pose suggesting action as opposed to the quiescence of the other (2), and this is further stressed by her superior height in the picture. The sitting position of (2), by which she is made to take up a lower placing, implies a subsidiary significance, and, while this is perfectly appropriate in the circumstances, she yet has sufficient "pull" to maintain her due share of the interest.

Moreover, the fact that the two figures are connected unifies the grouping and illustrates the skill with which their poses have been arranged. Not only is the subject exceedingly well constructed and admirably welded together, but a picture has been made out of the slightest of material to the greatest possible effect.

The bicycles, which, in the ordinary run of picture-making, nearly always prove an incongruous feature, seem a perfectly suitable adjunct, for, in conjunction with the dresses, they suggest the pursuit in which the figures are engaged, whereas it more usually happens that an inclusion of this sort leads to a suggestion of inadvertence.

It could be wished, perhaps, that the tone of the foreground immediately above the base-line were appreciably darker and heavier than that just above, for, besides conferring a greater feeling of stability, it would also cover up, to some extent, the slight diffusion arising from the fact that the portion in question is somewhat out of focus. Alternatively, a trim of somewhere about an inch would be equally efficacious. "MENTOR."

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

ONE of the many forms of disappointment that is experienced by the beginner in photography is that, when his exposures come to be developed, quite a considerable number show a misplacement of the image. Either too little has been included, or what is regarded as an essential portion has been cut off, or there is a certain amount of distortion arising from a departure from the level at the moment of making the exposure.

Placing the Subject.

No. 1 of the prints reproduced on the opposite page—"The Shady Church," by J. W. Clements—shows, for example, a lack of an adequate foreground. More is obviously needed, and it is probable that, when the subject was seen in the view-finder, it was either overlooked that it would show more than would be included in the negative, on account of the necessity for providing for vertical as well as horizontal pictures, or, owing to incorrect adjustment or inaccuracy through injury, the finder was tilted forward and actually indicated a greater amount of foreground than could possibly be taken.

Maladjustment of this latter type would be confirmed by the fact that all subjects would show the same disability, in which case it would be necessary for the instrument to be put into dock for repair; but if the first alternative applies and the function of the notches at each corner of the finder were not understood, it becomes apparent that a more distant viewpoint should have been chosen, the idea of the notches being that, when a vertical picture is being taken, the amount that will be included will be that limited on each side by a line drawn from the inside of the notch from top to bottom, and, in the case of a horizontal, the boundaries will be represented by a line drawn between the undersides of the two notches at the top and the upper sides at the base.

Finders and Screens.

In the case of direct-vision finders, inaccurate adjustment would be shown by a similar recurrence, which should likewise be corrected, or it may happen that the eyepiece section is placed too near the eye, a fault which experience will correct; but, however caused, the shortage of foreground does demonstrate the need for getting farther away from the subject.

If too much is included, it is a simple matter to trim the excess away or to enlarge only the portion that is required, or, if the camera is provided with a focussing screen, a scrutiny of it will show precisely what will be included and what will not. Moreover, a comparison between the finder and screen will usually show if the former is correctly adjusted.

Some of the finders fitted to folding cameras are made to swing from the vertical position to the horizontal and vice versa. These are provided with stops, and, unless the finder is in contact with one of them, its image will not coincide with that which will appear on the negative. Horizontal lines will not be level and verticals will be off the perpendicular.

This may be the reason why the verticals of No. 2, "From Stonor Hill," by Miss J. M. Howat, are out of truth, or, on the other hand, the camera may have been improperly held. The effect is unpleasing, but it could be corrected by trimming or masking, for, as the viewpoint was sufficiently distant, there is just enough margin to permit the adjustment.

Camera Manipulation.

The subject, otherwise, is well seen and selected, and, technically, it is well up to the level of its class. It is, therefore, somewhat surprising that the defect has escaped notice, but, now that attention has been drawn to it, it will doubtless be corrected in another edition.

"Eynsford," by A. C. Piper (3), is another well-chosen subject, but its presentation is marred by a diffusion of outline which may have been caused either by incorrect focussing or by movement of the camera at the time of exposure.

Which, in the absence of the negative, is impossible to say, but examination under a magnifier would provide an indication. If camera movement is responsible, there would be either a duplication of line or points of light would be elongated in the direction of the line of movement, whereas, if the focussing is at fault, there will be a general fuzziness if the lens were too near the plate or film, and, if it were too far away, objects near the camera will be sharper than those farther off.

Diffusion of Outline.

The probability is that examination will disclose a certain amount of movement, but, in the case of No. 4, "The Boat-builder," by B. French, the sharpness with which the distance is rendered and the diffusion of the boat and foreground seems to show an error in focussing, the lens being set too near the sensitive emulsion to suit the subject.

A certain amount of diffusion in the setting may be regarded as permissible, but, in the rendering of the principal elements of the subjects, it is highly undesirable. In a case like this, the figure should be sharply focussed whatever happens elsewhere, and, if the lighting prevents stopping down to bring the more distant planes into focus, they can be left as they are. They may be all the better for it.

An instance where this device has been adopted is to be seen in No. 5, "Evening Shadows," by J. H. Forsyth, where the nearer cottages are well defined and those more distant together with the trees show just a trifling falling-off of outline. Such a method of presentation is perfectly legitimate, for, although it is not precisely the same, it simulates the way the eye picks out the object it is looking at while disregarding other items within the field of vision. The foreground, as in the case of No. 1, is scarcely adequate, and the remarks made in connection with that print are also applicable here.

Elementary Failings.

The definition in No. 6, "Ashby St. Ledgers," by Miss F. M. Flew, is, as far as can be seen, even throughout, but the subject seems to be well outside the "infinity" limit, and no difficulty in setting the focussing should be experienced. There are no other defects of manipulation to force themselves upon the attention, and the subject seems to be well and faithfully recorded. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

SUBJECTS BY THE WAY.

TO me one of the strongest attractions of " the pictures " is the opportunity they afford for studying composition. I am afraid I often lose the story, if by any chance there should be one worth following, because I am occupied in studying the ever-changing arrangement of the subject on the screen. I watch people moving about in their surroundings, indoors or out, till at last they are distributed, grouped and posed in just the right manner, and then I fire an imaginary shutter and say to myself, " Got it ! " Which of course I haven't.

Long before the advent of the movies I did the same sort of thing with the unfolding panorama seen through the window of a railway carriage, and I do it to this day. Some of the best landscapes I have ever missed have been seen in this way.

It is no use trying to snap them through the window. This was done long ago, and is still attempted by those who think the result acquires some special merit from the method. But the main thing it does is to disillusion us by showing that the picture was nothing like as good as we fancied it. The fish we catch is never as big as the one that broke away.

The same sort of thing happens when we journey by road, especially, you will find, when we cannot stop where we like. No doubt we are misled by the cumulative effect of what we see, and mentally concentrate the interest and beauty of miles of road into one small area.

But there are times when we can traverse the roads at will, choose our route, diverge from it when we please, and stop when and where we like ; and then come opportunities of picking up subjects by the way or within easy reach of it.

The three illustrations are just average examples, and

Mill at Hadham, Essex.

Old Chapel, Brentwood.

are shown not because they are good specimens, but because they happen to be my latest. In a journey of an hour or two, say in a car, one may bring home as a record of the trip a dozen or more subjects not only as interesting but very much better, and sometimes worthy of that blessed word "pictorial."

At Hadham (generally and unblushingly pronounced Adam) I saw the sail-less body of a mill that had been a fine fellow in his prime. The hitherto bright sky had (naturally) become overcast and heavy; but I waited some time in the hope of a gleam of sun, and also in the hope that the farmer watching me from a distance was not as sure as I was that I had climbed a fence into his field. I chanced a shot at last, and the sun came out just as I was sneaking back over the fence.

When I developed the negative I found that I had included one of my companions in a light suit. I took him out, and if you can find where he was it is more than I can.

Just off the High Street at Brentwood stand the remains of a pilgrims' chapel first built by order of an abbot of St. Osyth in 1221. He did not include the chimney stack, which is the property of an estate agent next door, and the Abbot would not have blessed it. Nor do I.

The place-name Brent (as in Brentwood), Barnt, or Burnt, indicates a serious fire at some time. The burning of the church tower accounts for the name Brent Pelham, where I found the stocks by the churchyard. Many a naughty old boy of the village must have sat in them, as often as not for having taken nine (or more likely nineteen in those lusty days) at the inn hard by.

Stocks, Brent Pelham.

I advise you to keep an eye for subjects by the way—old buildings, gardens, landscapes, natives and other antiquities; all sorts of things. In these days the necessary apparatus will be no burden. It will be all the better if it has a good fast lens, a shutter with several speeds, suitable finder and focussing arrangement, and (excuse me) a rising front. But almost any camera will do, and its presence adds to the pleasure and interest of any journey.

W. L. F. W.

A Prize Competition for Novices

THIS competition is specially for those readers of "The A.P." who are Novices; that is to say, amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups, or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

Our readers who are Novices have all the summer in which to make their prints for this competition, and the prizes are worth having.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 30th. This will give new readers who are Novices, and who intend entering this competition, every opportunity of improving their work during the next two months by reading *The Amateur Photographer* every week and obtaining their competition prints during the summer holidays.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices" Competition.

Further reference to the competition will be made week by week, and hints given for the best treatment of various subjects for Novices.

CAN THE CAMERA LIE?—A New Competition

IN the Summer Number of *The Amateur Photographer*, published on July 22nd, a new competition was announced in connection with articles that appeared in that issue dealing with "pictorial inexactitudes." It was demonstrated that by judicious application of the camera, combined with unusual viewpoints, or by double exposures, results were obtained that on their face value appeared to be unreliable.

In this competition, prizes are offered for the best photographic "untruth," but the prints must be quite straight and from untouched negatives. Combination prints, or prints that have been built up by cutting out other photographs and copying, or prints that have been obtained by various "control" methods are not elegible for this competition.

The prizes are **5 guineas, 3 guineas, 2 guineas, 1 guinea** and **10s. 6d.** They will be awarded for what are considered to be the best efforts in making the camera "untruthful." The negatives of the winning prints and of any others must be submitted for inspection if required. Technical data should also be given regarding the production of the photographs.

There are no other conditions beyond those mentioned above. A special competition coupon, which appears each week in the advertisement pages, must be affixed to the back of each print. The closing date will be September 30th.

Entries should be addressed to the Editor, *The Amateur Photographer*, Dorset House, Stamford Street, S.E.1, and should be marked on the envelope "Special Competition."

Picture Points

No. 11 (New Series) *by RICARDO*

Avoid Blank Tones.

BY including a few clouds in a landscape we do more than make the scene look more natural—we obtain a better tone balance throughout the picture, and also provide variety in what would otherwise be a blank white sky.

Although we are more conscious of blank light tones, particularly if they are large and of the same tone as the paper base (always a bad fault with any print), this monotony of tone can occur with any other shade. When they appear in the extreme contrasts, white and black, they are then most noticeable and irritating.

In the top sketch, this fault has been carried to the extreme. Although there is a variety of tones in the picture, this is not enough. Each one is too monotonous in itself. Let us break up each one and get more variety into it, as in the lower sketch. If the negative can only give blank even tones then we are obliged to resort to careful handwork on the print. We now have a greater variety of tone in each plane without sacrificing too much of the general tone.

The sky is graduated in tone by overprinting the top, and this is preferable to leaving the sky quite blank.

Creating the Third Dimension.

THE suggestion of perspective, or, as it is sometimes called, the "third dimension," can often make or mar a picture, particularly where the subjects included have concrete forms, ranging from portraiture to landscape.

We all have a certain understanding of how various objects are constructed, whether it be a flower or a farmhouse, and while any lens from a normal viewpoint will give us a pleasing rendering of the length and breadth of such objects, it does not always follow that the third dimension will be just as natural. The viewpoint taken by the camera, the nearness of the object, and the focal length of the lens, the size of the print, and even the stop used, and several other factors, all have a say in the matter.

Should, for any reason, the suggested perspective look unreal then the whole picture begins to look unconvincing and so loses our interest.

For the more general type of landscape or seascape it is a good plan first of all to concentrate on subjects which can offer successive steps or planes from the camera to the farthest object. A simple form of this is to have a foreground, middle distance and distance, and an object on each of the three points.

If we compare the two sketches we can follow the idea much better. The top sketch shows a landscape with a distant plane only, and the lower sketch shows, by providing two nearer planes, a more convincing perspective.

Opposing Directions in the Subject Matter.

IN a previous "Picture Point" we discussed the usefulness of a figure for leading the eye into the picture, either by suggested movement or by pointing. This device can be employed in various ways, but it should always be used sparingly and with discretion, as it can easily become too obvious and defeat its purpose.

But an even greater danger lies in overdoing the number of figures, especially when they are looking or being active in opposite directions, and also if the figures are of equal importance regarding size, sharpness of focus, tone value, and relative position in the picture space.

A good example of this fault is to be seen in the first sketch. Approximately the same distance from the left and right hand sides, the two figures are facing and working the opposite way, as indicated by the arrows. The two figures, being roughly of the same size, are already each competing for attention, while the added attraction of their activeness, each so near and towards the edge, can only lead to divided attention in the picture. It can safely be said that there are two pictures and yet there is not sufficient space on the "direction" side of each to give good balance.

If we must have the two figures in the same pose, then we must place them nearer together and give preference by focussing or by size to only one of them. A suggested improvement on these lines is shown in the right-hand sketch. By varying the action or pose of each the gain is greater still.

OUR MINIATURE CAMERA SERVICE

In the first place, when on the point of buying a camera our absolutely unbiased opinion is at the service of customers who may feel rather at a loss when confronted with a large number of attractive alternatives now available. Given the purposes for which the camera is intended to be used, we are pleased to assist with suggestions as to the most suitable apparatus for the particular work. (Only miniature cameras of repute are kept in stock, thus automatically protecting our customers from acquiring unsatisfactory apparatus.) Subsequently we are glad, whenever possible, to assist in the production of good work by constructive criticism and advice. We pride ourselves on taking a permanent interest in our customers.

For those Contax or Leica users who find the usual 36-exposure films excessive, we keep a small staff occupied loading cassettes with any number of exposures. We have established a "Miniature Only" developing service carried out entirely by intelligent operators with a long practical experience of miniature photography (free posting bags and film speed charts are available). Our newest enterprise is the repair service for miniature cameras described below. Finally, cameras obtained originally from us are re-purchased or part-exchanged under specially advantageous terms. These, we consider, constitute excellent reasons for buying your miniature camera from the miniature camera specialist.

THE FOLLOWING LIST REPRESENTS A SELECTION OF USED MINIATURE CAMERAS FROM OUR STOCK. WE HAVE, BESIDES THESE, THE MOST COMPREHENSIVE COLLECTION OF NEW MINIATURE CAMERAS AND ACCESSORIES TO BE FOUND IN GREAT BRITAIN. OVER FIVE HUNDRED DIFFERENT ACCESSORIES FOR THE LEICA CAMERA ONLY ARE TO BE SEEN AT OUR SHOWROOMS

WITH EACH OF THE SECOND-HAND CAMERAS LISTED BELOW WE GIVE A WRITTEN GUARANTEE OF MECHANICAL AND OPTICAL PERFECTION.

LEICAS:

Leica Model IIIa, fitted latest pattern rectilinear focussing f/1.9 Hektor. Unsoiled in any way £45 0 0
Leica Model IIIa, f/2 Summar lens, ever-ready case. As new £34 10 0
Leica Model III, black, f/2 Summar lens, ever-ready case. As new £31 10 0
Leica Model III, black, f/3.5 Elmar lens, ever-ready case. As new £23 17 6
Leica Model II, black, f/3.5 Elmar lens. Excellent condition £18 10 0
Leica Model II, black, f/2.5 Hektor lens. As new £21 10 0
Leica Model I, f/3.5 Elmar lens, interchangeable. Excellent condition £10 10 0
Leica Model I, f/3.5 Elmar, non-interchangeable. Good condition £7 18 6
Leitz f/3.5 Elmar, 3.5-cm., coupled, nickel £6 7 6
Leitz 5-cm. f/3.5 Elmar, coupled, nickel £6 7 6
Leitz 13.5-cm. f/4.5 Elmar, uncoupled. In good condition £7 5 0
18-cm. f/5.5 Tele-Megor, coupled for Leica with special finder. As new £18 15 0
Leitz Stereo Viewer £5 5 0

CONTAXES:

Contax Model I, wedge-type range-finder, f/1.5 Sonnar lens, ever-ready case. As new £42 10 0
Contax, as above, but with f/2 Sonnar lens £32 17 6
Contax, as above, but with f/2.8 Tessar lens £25 17 6
Contax, as above, but with f/3.5 Tessar lens £23 17 6
Contax, as above, but fitted earlier type range-finder, with f/2.8 Tessar lens £23 10 0
With f/3.5 ..... £21 10 0

The following Telephoto Lenses will fit either Models I or II Contax:—
Zeiss 8.5-cm. f/2 Sonnar Lens. As new £26 10 0
Zeiss 12-in. f/8 Tele-Tessar, with filter and special case. Cost £48. As new £30 0 0
Contax Plate Back, £3 5 0. Extra Slides, 5s. 6d. each. Contax Magniphot Enlarger, to take lens from camera. Excellent condition, £6 17 6.

MISCELLANEOUS:

Contaflex, f/2 Sonnar lens, ever-ready case. As new £55 10 0
Latest 6×6 Automatic Rolleiflex, f/3.5 Tessar lens, Rapid Compur, ever-ready case. As new £20 10 0
Latest 4×4 Automatic Rolleiflex, f/2.8 Tessar, Rapid Compur case. As new £21 10 0
Automatic 6×6 Rolleiflex, f/3.8 Tessar, Compur, ever-ready case. Excellent condition £16 15 0
Automatic Rolleiflex 4×4, f/2.8 Tessar, norma Compur, ever-ready case £17 10 0
Rolleicord, f/3.8 Triotar, ever-ready case. As new £11 17 6
Exakta Model A, f/3.5 Ihagee anastigmat. Good condition £11 10 0
Exakta Model A, f/3.5 Tessar. Excellent condition £13 17 6
Exakta Latest Lever-wind Model A, f/2.8 Tessar, case. As new £19 10 0
Multispeed Exakta, f/1.9 Dallmeyer Super-Six, extension tube, lens hood, universal case. Excellent condition £26 10 0
Voigtlander Superb, f/3.5 Skopar. As new £11 17 6
Ikoflex Model II, f/3.5 Tessar, Rapid Compur, case. As new £16 17 6
Latest Improved Model Korelle, f/3.5 Tessar, ever-ready case. As new £14 15 0
Baldax, 16-on-3½×2½, f/3.5 Trioplan, Compur. As new £5 15 0

MISCELLANEOUS—contd.

Baldi, 16-on-V.P., f/2.9 Trioplan, Rapid Compur. As new £6 10 0
Kodak Nagel Pupille, 16-on-V.P., f/2.8 Tessar, Compur, ever-ready case. As new £12 15 0
Kodak Nagel Pupille, f/3.5 Elmar lens, Compur, special reflex attachment. Excellent condition £12 15 0
Nagel Rolloroy, f/2 Xenon lens, case. Excellent condition £10 15 0
Dolly, f/2 Xenon, Compur. As new £8 15 0
Miniature Marvel, f/2 Xenon, Compur. As new £8 17 6
Weltur, 16-on-3½×2½, f/2.8 Tessar, Compur shutter, coupled range-finder combined with view-finder. As new £17 15 0
Zeiss Super Ikonta 530, f/3.5 Tessar, case. As new £13 10 0
Zeiss Super Ikonta 530/16, f/3.5 Tessar, Rapid Compur. As new £19 17 6
Zeiss Super Ikonta 530/2, f/3.8 Tessar, Rapid Compur, ever-ready case. Cost £24. As new £19 10 0
Fotet 3×4 cm., f/3.5 Trioplan, Compur, purse. Excellent condition £4 17 6
Piccochic 3×4 cm., f/2.9 Vidanar, Compur £4 7 6
Foth-Derby, f/2.5 lens, Compur. Good condition £5 12 6
Exakt Enlarger, Model IIa, for 6×6 cm. negatives. As new £15 15 0
Retina, f/3.5 Xenar, Compur, case. As new £6 17 6
Minifex, f/3.5 Trioplan, Compur £5 15 0
Welta-Perfekta, f/3.5 Trioplan. As new £12 17 6
Ikoflex Model I, f/6.3 Novar, Derval shutter. New condition £4 17 6
Zeiss Super Ikonta 530/16, f/2.8 Tessar, ever-ready case. As new £23 17 6
Zeiss Super Nettel, f/2.8 Tessar, case. As new £17 15 0
Multispeed Exakta, f/2.8 Tessar, case. As new £21 10 0
Plaubel Makina 3½×2½, f/2.9 Anticomar, 3 slides, F.P. adapter, case. As new £28 10 0
Six-20 Duo Kodak, f/3.5 lens, Compur, 2 filters, case £7 17 6
Voigtlander Virtus, f/3.5 Heliar, Compur shutter. As new £8 5 0

DEVELOPING AND PRINTING OF 35-MM. FILMS.—OUR DEVELOPING SERVICE FOR LEICA AND CONTAX FILMS IS THE ONLY COMPLETELY SPECIALISED ONE IN EXISTENCE. WE SUGGEST THAT SERIOUS AMATEURS WHO FIND THEMSELVES NOT IN A POSITION TO DO THEIR OWN WORK AND WHO HAVE HAD BAD EXPERIENCE OF ORDINARY COMMERCIAL SERVICE SEND THEIR FILMS TO US. DETAILS ON REQUEST.

We have now established a speedy and moderately priced EXPERT REPAIR SERVICE for miniature cameras. Besides the ordinary run of repairs, we are able to adjust the coupled range-finders to this type of camera, and also to dismantle, clean and repolish the extremely soft and delicately adjusted wide-aperture lenses with which they are usually fitted. Estimates supplied for any work.

PART EXCHANGE ON MINIATURE CAMERAS

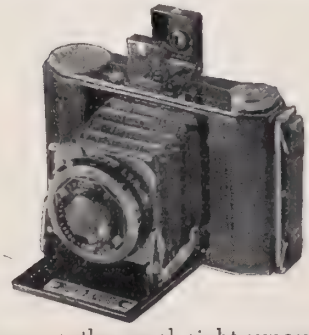
As specialists, we are in the position, where miniature cameras are concerned, to pay the highest cash prices and to give exceptionally generous allowances in part exchange. Why not call or write for a quotation.?

R. G. LEWIS, The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1
(HOLBORN 4780) (Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

Every beautiful detail made crystal clear . .

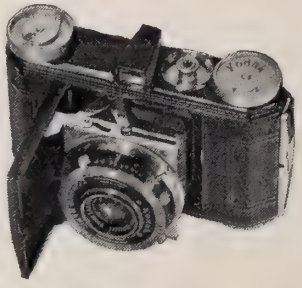
If the details in your pictures are apt to be blurred, change to a Taylor-Hobson lens. The result will surprise you. It will be just as though you had lifted a veil off the "eye" of your camera.

TAYLOR-HOBSON LENSES



Made by
TAYLOR, TAYLOR & HOBSON LTD.
Leicester and London

Photography takes on new thrills



with one of these precision-made fast-lens miniature "Kodaks"

SIX-20 DUO "KODAK"

Takes 16 pictures on the usual eight-exposure Kodak Film No. 620. Fast f4.5 and f3.5 lenses in multi-speed shutters, including 1-1/300th "Compur." Optical eye-level viewfinder, springs into position at a touch. Focussing down to 3½ feet. Depth of focus scale. Picture size 2¼ x 1⅝ inches—negatives make reasonably-sized contact prints and big crisp enlargements. - - - - From **£6.0.0**

"RETINA"

Holds film for 36 exposures at a single loading—Kodak 35mm. Film, "Panatomic" or Super Sensitive Panchromatic grades. Very fast f3.5 lens in 1-1/300th "Compur" or 1-1/500th "Compur-Rapid" Shutter. Automatic exposure counter. Automatic film spacer—no overwinding. Optical eye-level viewfinder—all-enclosed spyglass type—gives brilliant clear image. Depth of focus scale. - From **£10.10.0**

KODAK LIMITED, KODAK HOUSE, KINGSWAY, LONDON, W.C.2

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

The Ciné Camera in Camp

By E. APPLEBY.

THERE are few places where there is more scope for a ciné camera than in a camp, small or large. The humblest little instrument can secure results which will help to recall the happy times when the dark evenings are here again, and no one need fear his inability to produce a good film record of the camp if he will but observe ordinary intelligent precautions.

Camping consists of a number of incidents strung together in what at first appears to be a haphazard fashion, but is by no means so, and surely this is the basis of all story films—a series of incidents strung together.

The great advantage about the camp film is that odd shots can be taken at any time, providing they are of active interest, and then the whole can be united in the editing to make a complete record.

If the camp is a large one it is better to have two camera workers collaborating, one to take the more mundane features of the event, and the other to look out for humorous interludes, of which there are usually an abundance.

As in all ciné work, some sort of plan is definitely needed. Some shots can be prepared at home, before the camp, or even after the event. For instance, the shot of one of the campers awakening on the morning of the start, a close-up of the clock, back on to the waking person to show his look of alarm and his sudden spring out of bed, can all be taken specially at any time, preferably in the lightest part of the day if the camera is not very well equipped from a lens point of view.

The getting of baggage to the station, if the party is going by rail, will prove a useful opening to the film, and if a close watch is kept little trouble will be found to get in one or two humorous incidents. Incidentally, here it may be mentioned that humour is one of the main features of camp life, and on no account should any humorous incident be missed. Large smiles can be caused by getting one of the members to attempt to lift a huge sack, and then to get a porter to throw the same sack easily into the luggage-van, to the discomfiture of the first individual. Of course the person in question should be informed of the idea in mind, as some people are extremely sensitive on some of these questions.

Erecting the camp is the place to get the pictures, as also, of course, is the time of striking, and, much as it may go against the grain, the operator should be absolved from all duties on these occasions, and be buzzing round with the camera shooting as much incident and movement as possible.

A brief panning shot of the empty field, and then from time to time switching from medium-shots to show the camp taking shape, will prove quite an interesting subject, and the final one of this series showing the camp all complete, with the workers standing in a group admiring it, will give to future audiences the camp atmosphere and get them into the mood to enjoy incidents that may be portrayed later.

Early morning against-the-light effects are very beautiful in camp, and studies of members fetching water and doing other tasks with the sun behind them will be quite effective provided a lens shade is used and sufficient exposure is given. It must, of course, be remembered that there will be a great tendency to under-expose in this case.

Meals in camp are taken in various ways, according to the size of the camp. Alfresco meals, where the campers sit round the camp fire and wait anxiously for the stew to be done, are perhaps the most useful from a cinematic point of view. The camp cook, attending to his camp fire, should also prove a useful subject, especially if he can be prevailed upon to get himself well blacked up, and to appear to burn himself a few times. A fellow with histrionic ability would be an exceedingly useful person in a case like this.

Even experienced campers trip over ropes and tent pegs from time to time, and though theirs is a pained expression, it usually calls forth hilarity from the onlookers, and the older the camper the bigger the laugh. It is well to be on the look-out for this. With a little knowledge of camp life it is almost possible to foretell when a fellow is going to do it, and there is almost invariably one person in camp who does it repeatedly. Get him if you can—it's part of camp life.

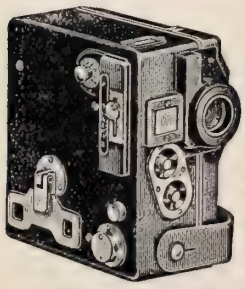
The expenses of the camp film should be shared by the whole party, and in this way it will be possible to shoot many subjects that might otherwise have to be left out on the ground of expense if

A "medium shot" of camp life. A good subject with endless variations for the amateur ciné worker.

the whole business is left to one individual. The size and type of camera is really not of much consequence, as filming is performed under ideal conditions, both from the light point of view, and also because the members of the party have thrown off their habitual restraint and are more likely to act naturally.

The camera should be always available, and the motor kept well wound up, because the incident you want most will almost certainly occur when the film is on its last few feet or the motor is at its last gasp.

Organised scenes can be attempted if the amateur has any ideas on the subject. In this case the camera-man should not try and take the picture and direct operations as well; such an attempt will end in disaster. One or two people always stand out as leaders in camp life, and their collaboration should be sought, when it will be found that they will organise the event quite well, and the operator can devote all his time and attention to the actual filming.



The medium-shot will be one of the most important ones in the camp film, but remember that a continuous procession of such shots will be monotonous on projections, and a close-up should be interposed and then perhaps a long-shot wherever it is possible.

A general view of the camp should be included.

THE "DITMAR" 9.5-mm. CINÉ CAMERA

A MINIATURE ciné camera of outstanding merit, and embodying a number of attractive and novel points, has been introduced recently to this country by Actina, Ltd., 29, Red Lion Square, High Holborn, W.C.1. It is called the "Ditmar," and is for use with 9.5-mm. film. It is of a neat and convenient shape for holding when in action, and has a very sensibly placed strap, which enables it to be firmly gripped with one hand. Among its outstanding features the following should be noted: The diaphragm aperture can be altered while actually shooting without taking eye from view-finder. This is an important feature for varying light conditions. At the same time the aperture in use and the length of film already exposed can be noted also, which is an obvious advantage. This is seen on a scale above the view-finder, but does not obstruct the view. Variation of speeds can be effected during actual running, without interruption, by pressure of one or both buttons, giving, if required, instantaneous change from normal to slow motion. Vertical parallax is corrected by the lens and view-finder being on the same level. This avoids the trouble of cut-off heads in close-ups. Horizontal parallax is compensated by a sliding eyepiece. The picture appears then through a tinted screen acting as a reminder when reverting to normal distances. Further advantages of the camera are that the lens is in a fully protective sunk mount. Wide-angle and telephoto, also portrait attachment and filter, can be fitted to the lens by universal screw mount. The motor is smooth in action and the internal mechanism is simple and efficient. Hand crank for single frames is fitted, or the shutter can be set for continuous running, and the film release can be locked to prevent accidental starting. The little camera is sturdily built, with metal body, and is beautifully finished. The "Ditmar" complete to take 30-ft. cassette of film with f/2.9 Cassar lens is £12 12s. With Berthiot f/1.8 lens and focussing mount, £16 16s. It is also made to take 8-mm. film. Full particulars from the above address.

A READER OF "THE A.P." MAKES A FILM OF HISTORIC INTEREST

READERS of "The A.P." do not need to be reminded of the incident of the man with the revolver when His Majesty the King was riding back to Buckingham Palace after the ceremony of presenting the Colours on the Horse Guards Parade.

A reader of *The Amateur Photographer and Cinematographer*, Mr. E. A. Bartlett, who is a keen cinematographer, was in the crowd with his camera (a 9.5-mm. Pathéscope) when the King passed, and he started to take a shot at the moment the incident occurred. He not only recorded the King himself, but, seeing the incident, had the presence of mind to turn the camera back, and caught the mounted policeman dashing for the man and the revolver.

When he realised the importance of his film he promptly took it to be processed (to Wallace Heaton's at Berkeley Street). He then rang up *The Evening News* and told them the story. Within a very short time he was besieged by press men and film representatives who were anxious to get the film at any price, but they wanted it at once.

Then the fun commenced, which he thus describes: "I dashed back to the shop to try to recover the precious film, but, alas! only a few minutes before, the assistant who had taken my instructions had packed it for despatch and then gone to lunch, taking the film with her to post, and no one seemed to know where she had gone, so I just went back, got on the telephone and told the Press so.

"They then began frantically asking where it had been addressed, and what time I expected it to arrive. Meanwhile, other film companies started to ring me up and make enquiries regarding the all-important film, sent representatives round to see me, and had fast cars despatched to Cricklewood to await its arrival, but as it did not come through, after a time, in desperation, they rang up the G.P.O. and had the packet speeded up.

"I understand they were waiting at the Pathéscope works at Cricklewood until 9 o'clock that evening, although the historic 12 ft. of film was not purchased from me until the following day by the Universal Talking News, to whom I sold the exclusive rights of showing. It has been enlarged and is now included in their full-length film of the King and his Guards on show at several leading news theatres in London and throughout Great Britain."

Exhibitions and Competitions CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions or Beginners, Intermediate and Advanced Workers.—Entries, August 31. Rules in issue of July 29

The Amateur Photographer Novices' Competition. Prizes of Roll Film for Novices' Prints. Closing date, September 30. Rules in this issue.

The Amateur Photographer Special Competition, illustrating "Can the Camera Lie?" Entries close September 30.

Wallace Heaton "35-mm. Film Competition." Cash prizes every week. Open to readers of *The Amateur Photographer* only. Full particulars in advertisement page in this issue.

XVme Salon International de Photographie de Bruxelles.—Open, May–October. (M. Maurice Broquet, Secretaire du Salon, Rue du Sceptre, 77, Brussels.)

Salon International de Fotografica de Madrid. (Señor Secretario de la Sociedad Fotografica de Madrid, Calle del Principe, 16, Madrid.)

The Listener. Cash prizes for photographs under general title "Conversation Pieces."—Open, July 8–August 25. Entries, Monday morning of each week. (Editor, *The Listener*, Broadcasting House, London, W.1.)

Chicago International Salon.—Open July 23–October 4. (Alex. J. Krupy, Chicago C.C., 137, North Wabash Avenue, Chicago, Ill.)

I International Kunstphotographische Austellung in Karlsbad.—Open, July 18–August 9. (Hugo Heyer, Schulgass, 26, Karlsbad.)

XXXIe Salon International D'Arte Photographique de Paris.—Open, October 3–18. (M. E. Cousin, Secretaire de la Société Française de Photographique, 51, Rue de Clichy, Paris (9E).)

Radio Photo-Club de Spa. IVme Salon International de Photographie—Open, August 9–30. (M. René Chalsèche, Avenue Marie-Thérèse, 13, Spa, Belgium.)

I Salon Internacional de Fotografia de San Sebastian—Open, August 5–20. (Sr. Secretario General Salon Internacional de Fotografia de San Sebastian, Calle San Marcial, 26, San Sebastian, Spain.)

Forty-fifth Toronto Salon of Photography.—Open, August 28–September 12. (W. H. Hammond, Secretary, Toronto Salon of Photography. 2, Gould Street, Toronto, Canada.)

Museum and Public Library, Maidstone. Exhibition of Nature Photography.—August 15–29. (C. E. Fisher, Museum and Public Library, Maidstone.)

Tweede "Focus" Fotosalon.—Entries, August 10; open, September 12–27. (Focus, Ltd., Fotosalon, Bloemendaal, The Netherlands.)

South African International Salon.—Entries, August 14; open, October. (Hon. Secretary, Johannesburg P.S., P.O. Box 7024, Johannesburg, South Africa.)

Royal Photographic Society Annual Exhibition.—Entries, August 14; foreign entries, July 31; open September 12–October 10. (Secretary, R.P.S., 35, Russell Square, London, W.C.)

Buffalo C.C. Fourteenth Annual Salon of Photography.—Entries, August 15th; open, September 6–27. (H. W. Schonewolf, 528, Elmwood Avenue, Buffalo, N.Y., U.S.A.)

Morecambe, Heysham and D.P.S.—Entries, August 19; open, September 9–16. (James F. Levisohn, B.Sc., 5, Douglas Drive, Heysham, Lancs.)

Fotoclub Zagreb. Fourth International Salon of Photography.—Entries, August 20; open, October. (Fotoclub Zagreb, Masarykova II, Zagreb, Yugoslavia.)

London Salon of Photography.—Entries, September 2; open, September 12–October 10. (Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

Lincoln Camera Club.—Entries, September 5; open October 15–November 12. (Miss E. Redfern, 146, Burton Road, Lincoln.)

XII Salon International de Fotografica, Zaragoza, Spain.—Entries before September 10; open, October. (Secretary, Sociedad Fotografica de Zaragoza, Plaza de Sas, 7, Zaragoza, Spain.)

Third Canadian International Salon of Photographic Art.—Entries, September 10; open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, National Gallery of Canada Ottawa, Canada.)

Windlesham C.C.—Entries, September 10; open, September 25–26. Classes for members (Beginners, Advanced, Professional, also Open Class). (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

IV International Hungarian Exhibition.—Entries, September 15; open, October 24–November 9. (Secretary, Magyar Amatörfényképezök, Orsz, Szövetsége, Budapest VII, Erzsébet-körut, 9, Hungary.)

Rotherham P.S. Forty-seventh Annual International Exhibition.—Entries, September 21; open October 14–17. (E. George Alderman, Ruardean, Newton Street, Rotherham.)

Service Co. (London), Ltd., Happy Camp Snaps Competition. Cash prizes.—Entries, September 30. (Service Co. (London), Ltd., 273, High Holborn, London, W.C.1.)

Coronet Midget Camera Competition. Cash prizes.—Entries, September 30. (Coronet Camera Co., 310, Summer Lane, Birmingham, 19.)

Eighth International Photographic Salon of Japan.—Entries close in Tokyo, September 30; open, November (Tokyo and Osaka). (Sec., International Photographic Salon, Tokyo Asahi Shimbun, Tokyo, Japan.)

Photographic Society of America 100 Print Salon. Entries, October 1. Limit 4 prints. Entry fee $1.00. (Dever Timmons, Salon Secretary, Box 216, Cashocton, Ohio.)

Johnson's "Holiday" Competition. Cash prizes.—Closing date, October 31. (Johnson & Sons, Ltd., Hendon, N.W.4.)

U.P. International Exhibition of Photography, 1936 (Lucknow).—Entries, November 1; open, December 5, 1936–February 4, 1937. (Dr. K. N. Mathur, D.Sc., A.R.P.S., Hon. Sec., U.P. Amateur Photographic Association, Lucknow University, Lucknow.) Entry forms obtainable also from the Editor of *The Amateur Photographer*.

Tenth International Christmas Salon of Pictorial Photography (Antwerp).—Entries, November 15; open, December 20, 1936–January 3, 1937. (J. Van Dyck, Sec., Fotographische Kring "Iris," Ballaestr. 69, Antwerp.

Leicester and Leicestershire P.S. International Exhibition of Pictorial Photography.—Open, February 22–March 14, 1937. (H. Foscutt, 19, Doncaster Road, Leicester.)

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. They are printed in either the vertical or horizontal form as shown here, and each is complete in itself.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 × 3, supplied for card index cabinets.

The collection when completed will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index, and are now ready. The size of the box is 5½ × 3½ × 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, S.E.1. Price 2s. 6d.

22 FACTORIAL DEVELOPMENT

THIS practical method of development (due to the late Alfred Watkins) is based on the fact that for any given developer the time taken for the first trace of the image to appear on the negative has a direct relationship to the total time necessary for complete development.

The time is counted from the moment the plate or film comes in contact with the developer until the first evidence of the image is seen. This time is multiplied by the factorial number of the developer in use.

Provided that the exposure is reasonably correct, and that throughout development the developer is not weakened, restrained, or strengthened, and that the temperature remains constant, this method will be found accurate.

The type of developer used, its dilution, and its temperature, the type of emulsion, whether slow, medium or fast, whether ordinary, orthochromatic or panchromatic, irrespective of the base, whether glass, film or paper, all these variants are taken into consideration in this method.

If panchromatic plates or films are used, it is advisable to desensitise them first. Should the results be too contrasty reduce the factorial number, and if flat or lacking in correct contrast increase the number.

FACTORIAL NUMBERS.

Developer.		Factor.
HYDROQUINONE		5

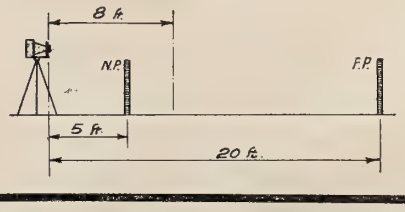
Example.—Time of first appearance of image with M.Q. developer, say, 10 seconds. Multiplying factor 18. Total time for complete development 180 seconds, or 3 minutes.

23 FOCUSSING POINT

THE following formula is used when it is necessary to cover a certain known depth of field, but the exact point on which to focus the lens is not known.

The advantage of this method is that the lens need be stopped down only just sufficiently to cover the depth of field required, thereby allowing the shortest possible exposure, a big consideration if the picture includes moving objects.



To arrive at this focussing point, multiply the distance of the nearest point (N.P.) of the subject by the distance of the farthest point (F.P.) and double the product. Then divide this by the sum of the two distances.

$$\frac{N.P. \times F.P. \times 2}{N.P. + F.P.} = \text{Focussing point for lens.}$$

This applies to all subjects, whether close up or distant.

Example.—On what point should the lens be focussed when the nearest point of the subject is five feet and the farthest point is twenty feet away?

$$\frac{5 \times 20 \times 2}{5 + 20} = 8 \text{ ft.}$$

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer

Focussing on Mirror Reflections.

On what plane should I focus a reflection of an object seen in a glass mirror, on the mirror itself or on double this distance? C. B. (London.)

If you wish to focus sharply on the object itself seen in the mirror, you must set the scale to the sum of the two distances of (1) camera to mirror and (2) mirror to object. To photograph yourself reflected in the mirror the scale distance will then be exactly twice the distance between yourself and the mirror. If you could obtain a camera with a focussing screen this can be proved by watching the image. Should you focus on the mirror itself the reflected object would be out of focus, but the frame of the mirror would, of course, be perfectly sharp.

Photographic Societies.

Are there any clubs active in Hertfordshire? J. D. (Bushey.)

There are only two photographic clubs in Hertfordshire, and they are as follows: Letchworth Camera Club, Secretary, H. Meyer, 5, Souberie Avenue, Letchworth. Watford Camera Club, Secretary, J. S. Walker, 85, Tudor Avenue, Watford.

Hypo-Alum Toning.

What advantages, if any, has the hypo-alum method of toning prints over the conventional method of bleaching and redevelopment by sulphiding? What is the hypo-alum formula? E. M. R. (Walthamstow.)

The hypo-alum method of sepia-toning prints requires only a single bath of plain hypo and alum, against the double bath process of the other. The hypo-alum bath keeps well and is therefore more economical, and, up to a point, improves with use. It is the more convenient method to use for large numbers of prints. Dissolve 8 oz. of plain hypo in 40 oz. of hot water and then add 2 oz. of ordinary alum. Boil for three minutes. Allow to cool off to about 130° Fahr. and add 1 oz. of water in which 10 grs. of silver nitrate has been dissolved. A few drops of .880 ammonia will redissolve the precipitate in this second solution. It is advisable to add also a potassium iodide solution of 20 grs. to 1 oz. of water. The prints, which should always be correctly exposed and fully developed, are placed in this solution, which should be kept at a temperature of 120° to 140° Fahr. This method gives off a most disagreeable odour and should not be used where photographic sensitive materials are used.

Pictorial Composition.

Can you recommend me any books dealing solely with the subject of pictorial composition for photography? T. R. C. (Worcester.)

A good, well-illustrated handbook, although small, is by an American author, Herman Gabriel, called "Composition Simplified," price 4s. 2d., post free, obtainable from Sands Hunter and Co., Ltd., 37, Bedford Street, London, W.C.2. A more recently published book, "Composition for Photographers," by Richard N. Haile, published by Ensign, Ltd., of High Holborn, London, W.C.1, at 10s. 6d., is much larger and more informative, and deals with composition from the photographer's point of view in a very interesting way.

Customs Regulations.

What are the Customs regulations regarding cameras for holiday makers visiting France and Germany? B. J. (Oldham.)

You will find all the information you require in the issue of this journal of July 22nd, where, on page 80, complete details supplied by the British Department of Overseas Trade were given for all countries.

Sky Filters.

What are the different effects of a light yellow, a deep yellow, a green, an orange, and a red filter on white clouds and a blue sky? What emulsions should be used with each of these? G. M. L. (Eastbourne.)

A light yellow filter would give an almost correct colour rendering of the subject with the blue appearing a little darker than the clouds in the positive print. A deep yellow filter would give greater contrast and make the blue look darker. A pure green filter, which consists of yellow and blue, can give varying degrees of tones to the blue sky, according to the proportion of yellow present in the green. An orange filter yields a slightly darker tone to the blue than the deep yellow filter, while the red filter, being a complementary colour to blue, would make the blue look almost black. The yellow filters can be used with both orthochromatic (or isochromatic) and panchromatic emulsions, but the green, orange and red filters should be used only with panchromatic emulsions.

Duplicate Competition Prints.

If two competitions closed on the same date, is it in order to send a duplicate print to each? W. A. B. (Manchester.)

We know of nothing to prevent your doing what you suggest. The only difficulty that may arise is that some awards involve the surrender of the negative and copyright, and, if this occurred in two places at once, you would obviously be in a rather awkward position.

Photographic Societies.

Where can I obtain a list of all the photographic societies in and around London? J. D. (London.)

A complete list of all the photographic societies in England, Wales and Scotland is to be found in the current issue of "Photograms of the Year," obtainable from our publishers, price 5s. 6d., post free. It includes ciné clubs, postal clubs, and supplies also the name and address of secretary, place and time of meeting, and subscriptions.

Press Agencies.

Can you oblige me with a list of photographic Press agencies in London, also a book on the subject of free-lance photography? D. F. (Surrey.)

The Associated Press of Great Britain, Ltd., 2 and 3, Hind Court, Fleet Street, London, E.C.4; British International Photos., 176, Fleet Street; Central Press, Ltd., 119, Fleet Street; Keystone View Co., 12, Wine Office Court, Fleet Street; Planet News, Johnson's Court, Fleet Street; Photopress, Ltd., 10, Johnson's Court, Fleet Street; Sport and General Press Agency, 2 and 3, Gough Square, Fleet Street; "Topical" Press Agency, 10 and 11, Red Lion Court, E.C.4; Wide World Photos., Salisbury Square House, Salisbury Square, E.C.4. A book dealing with free-lance work is "Free-Lance Journalism with a Camera," by Rufus H. Mallinson, price 3s. 6d., postage 4d. You can obtain a copy of this book from Messrs. Sands Hunter & Co., Ltd., 37, Bedford Street, Strand, London, W.C.2.

That UNIQUE Paper

Unique in its combination of so many artistic and technical qualities, MEZZOTONE produces rich, warm prints by simple, direct development. The speed approximates to that of bromide paper, so that enlargements can be made with the same facility as contact prints. An extraordinary latitude corrects errors in exposure or development. The long scale of gradation gives positive values to the negative's every degree of light and shade.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS :

12 words or less.....2/6
2½d. for every additional word

Each paragraph is charged separately.

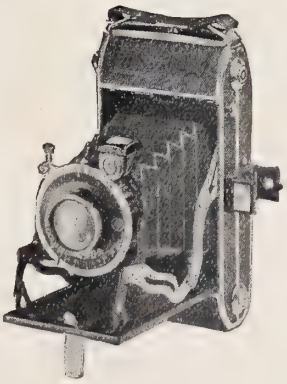
SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue : 13 consecutive insertions, 5% ; 26 consecutive, 10% ; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry ; Guildhall Buildings, Navigation Street, Birmingham, 2 ; 260, Deansgate, Manchester 3 ; 26B, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers



If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

The finest Roll Film Camera Value

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer." The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged ; over £10 and under £50, 2/6 ; over £50 and under £75, 5/- ; over £75 and under £100, 7/6 ; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed **& Co.**

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.
For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

DUNSCOMBE'S
"PERSONAL" CAMERA COLUMN
'SERVICE SUPREME'

ELMAR ACOOS

CHAPTER III.

Being extracts from his diary written in the Mayor's Parlour at Chortle-cum-Hardy.

"I have had a very hectic day with Mayor Itchin and the Surveyor on a little matter about drains. Mrs. Smith-y-Smyth, of the Old Manor House, complained of a nasty smell, which we duly had to investigate, and in due course were able to secure some realistic 'Bring 'em back alive' epic pictures of the cause of the bother, namely, 10,000 rats, more dead than alive, underneath the floor-boards in the green room of the west wing. The pictures, taken on the celebrated Kodak Super X film (only 1s. 6d. for 36 exposures for Leica Camera loaded, post free in your own spool-chamber), were remarkable considering the conditions under which we had to work, as only by holding the camera rock steady during the 1/8th sec. exposure at f/3.5 was it possible to get any result at all.

"We had no sooner returned from this expedition, when we were called upon to attend the Vicar's sale of work, a truly rural jollification, which called for intimate snapshots of the Vicar's wife endeavouring to sell last season's raspberry jam to the local grocer (retired). These snapshots were finally enlarged and beautifully coloured by Messrs. Dunscombe's, so that the grocer's face was an exact replica of the raspberry jam, in fact, as the Vicar afterwards remarked, it was indeed a very fruity picture.

"The next evening being the Mayor's night off, I accompanied him to the local palace of varieties, and from the first box on the right-hand side we got some excellent shots of the 'bally' dancing, as well as attractive angles of the chorus girls. Prints from these negatives are carried in water-cooled envelopes by the Mayor and shown secretly at the conclusion of council meetings, and are much enjoyed, especially by the Medical Officer for Health and the Sanitary Inspector.

"Whilst the latter mentioned pictures were quite attractive from the standpoint of the subject matter, there was a general tendency for under-exposure, and on my recommendation, Mayor Itchin very kindly arranged for me to have a Summar f/2 lens to augment my equipment, and accordingly an urgent message was sent to Messrs. Dunscombe's, who were able, of course, to supply one immediately from stock, and I am now getting thoroughly acquainted with this desirable lens.

"On Tuesday week my friend the Mayor is attending a Stag Party given by the Town Clerk, and, if rumour is correct, I shall have plenty to occupy my time and attention, and I am hoping that the adventures on this occasion will be worthy of inclusion in my book of memoirs, as, naturally, I can only pass on the high-lights of my daily adventures."

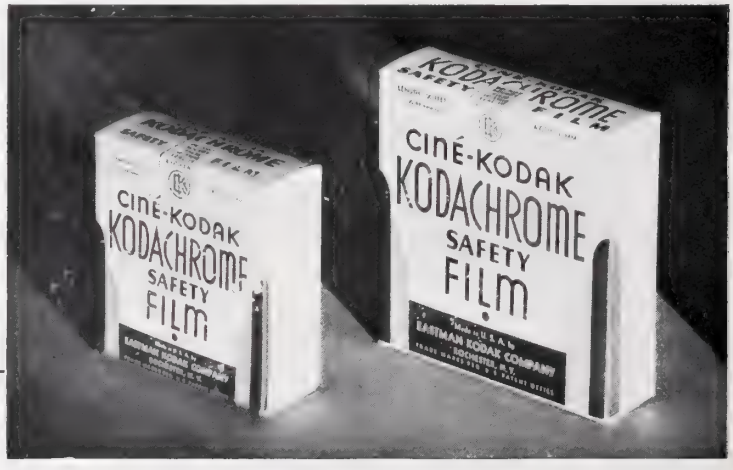
Colour photography made easy by

'KODACHROME'

the new 16 mm. ciné film

Never before has such a simple method of colour photography been available, nor one which gives such amazing results. Any 16 mm. Ciné-'Kodak' or other 16 mm. ciné-cameras taking 50 or 100 ft. rolls, or the Simplex Pockette or Bell-Howell Filmo No. 121, will take 'Kodachrome' movies as easily as black-and-white. No filters or extra equipment of any kind are necessary. Any 16 mm. projector will show 'Kodachrome' with full brilliance.

The colour in 'Kodachrome' is not built up of lines or dots; it is composed of pure colour images only, and contains no silver grains. Definition is critical even when using a large screen. No system of still photography can approach the wonderful results obtained with 'Kodachrome', so now is the time to take up motion pictures.



Write for free descriptive literature or ask your Ciné-Kodak Dealer for a demonstration.

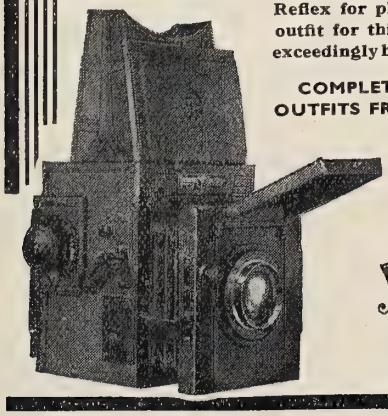
REFLEX CAMERAS
Ideal for ANIMAL PICTURES



READ WHAT USERS SAY:

"The camera which I purchased from you just a year ago has won me 6 good prizes, chiefly with animal studies." Miss T., Southsea.

"For some months past I have been using your Reflex for photographing Dogs. It is an ideal outfit for this purpose, its small size making it exceedingly handy." Mr. W. L. T., Cardiganshire.

Junior Model, £12

Ask your dealer to show it you.

THORNTON-PICKARD

ALTRINCHAM, 7 ENGLAND

PRICES :

$3\frac{1}{2} \times 2\frac{1}{2}$	$\frac{1}{4}$-Pl.	P/C.
21/-	30/-	42/-

WIN £25 WITH YOUR 35-mm. STILL CAMERA!

No entrance fee. Any user of the Leica, Contax, Retina, Rolleiflex or Rolleicord (if used with ciné film) can compete. The pictures on this page will give you an idea of the kind of pictures that win the prizes.

£25 CASH WILL BE AWARDED for the BEST PICTURE SUBMITTED THROUGHOUT THE COMPETITION

Here are the conditions :

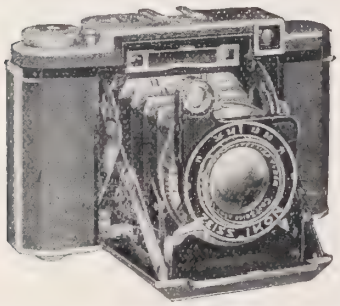
This Competition is open from now until September 30th. Your photographs can be of any subject—but they must be taken on 35-mm. film. Prints should not be smaller than 6 × 4 inches.

Any number of prints can be sent in in any one week, but each photograph must have the coupon attached. In addition to the big prize, a weekly prize of £1 1s. will be awarded for the best photograph submitted in that week.

Each photograph must have on the back a coupon as below, and the name and address of the sender, the make of camera and material used, exposure, etc.

For photographs which appeal to us, not necessarily prize-winners, we reserve the right to purchase the copyright by payment of £2 2s.; in the case of weekly prize-winners by the payment of an extra 21/-. The copyright of the £25 prize-winning print must be made over to us without further payment. *In addition we are offering a special prize of £1 1s. per month for the best photograph submitted depicting a person or persons using a camera purchased from Wallace Heaton Ltd. All prints will be judged at the end of the Competition for the final prize of £25 cash. Acceptance of these rules and conditions is a specific condition of entry.*

ADDRESS YOUR ENTRIES TO "COMPETITION," **(Phone : Mayfair 7511—8 lines.)**



COUPON which must be attached to your entry. **WALLACE HEATON** 35-mm. Film Competition. August 12th, 1936.

The WORD

LEICA

To all who follow the modern trend in Cameras that word "LEICA" means much. And at each and all of the "Four Westminsters" it has a significance all its own. There, LEICA Cameras and the wide range of LEICA accessories—hardly less notable than LEICAS in themselves—play a very big part in day-to-day and hour-to-hour activities. At any of the "Four Westminsters" you can see and examine the whole LEICA range.

Go then into any Westminster shop and learn all about LEICAS . . . and EXCHANGING your present Camera, or BUYING OUT-OF-INCOME, which is easily arranged—at the "Four Westminsters."

This is the LEICA Model IIIa, automatic focussing f/2 Summar lens, Shutter speeds to 1,000th. Costs £43, or 9 payments of £5 os. 4d. (Other models from £16.)

Ask about Special Leica "Valoy" and "Focomat" Enlargers.

PURMA

PATENT

SPEED CAMERA

British Patent 430,648 and 445,907.
World patents pending.

WITH FOCAL-PLANE SHUTTER — FOR SPEED SUBJECTS

Action and speed subjects are the ambition of every photographer—how often have you tried and failed? Get a PURMA, the new speed camera, and succeed with every shot. Look at the pictures it takes and think what you could do.

Its focal-plane shutter is the type of speed shutter which the Press photographer insists upon. The camera is ready for instant action, no focussing, no setting of lens aperture, no complicated calculations or adjustments. If necessary, the PURMA can be got ready with one hand in your pocket or behind your back, while you stalk your subject and wait for exactly the right moment to shoot—no movement is too rapid—no subject is impossible. It opens up a new field for you—speed photography.

Takes 16 square pictures (costing 1/-) on a daylight-loading vest-pocket film; 6 instantaneous speeds from 1/25th to 1/200th sec.

ONLY 35/-

Ever-ready Case 10/- (if required). See the name PURMA on the ever-ready case.

THIRD EDITION

REVISED THROUGHOUT

PHOTOGRAPHY MADE EASY

By R. CHILD BAYLEY
Author of "The Complete Photographer," "Hand Cameras," "Photographic Enlarging"

AS EASY AS A · B · C

This is a book for photographic beginners, and, if carefully studied, it will enable the novice with a camera to get a greater proportion of successful photographs than would usually be the case.

"Photography Made Easy" should be read by everyone taking up photography: it should form as much a part of the outfit as the camera itself: it is an ideal present to give an amateur photographer.

GEVAERT ROLL FILMS
for Perfect Pictures

SUPERCHROM EXPRESS 28° Sch.

For all sorts and conditions of snapshots, and particularly for all speed work and difficult subjects when the lighting is poor. A Film of really remarkable speed; very colour sensitive; double-coated, anti-halo and exceptionally fine grain.

PANCHROMOSA

Speed to daylight 26° Scheiner. For perfect colour rendering, fully panchromatic, fine grain, and to artificial light a speed of 28° Sch. For all general work, interiors, night outdoor photography, and artificial light.

And Panchromosa Special—extremely fine grain 21° Sch.

GEVAERT LTD., WALMER RD., LONDON, W.10

The F/4.5 BRILLIANT..

The "Brilliant" has a number of outstanding points. Its great feature is its hooded view-finder. . . You see the picture crystal-clear and *full size* whilst you take it. Then again, the "Brilliant" is economical—twelve 2¼-in. square pictures on a standard 8-exposure 2¼×3¼ in. film. For ease of operation, for certainty of success, for outstanding value, the Voigtlander "Brilliant" is remarkable.

With F/4.5 Skopar lens in Compur shutter..**£5 15 0**

Other models from **45/-** to **£6 15 0.**

Ask your dealer, or write for the new Voigtlander catalogue to Schering Ltd. (Voigtlander Dept. A), 188-192, High Holborn, W.C.1.

NOW - Your CAMERA CAN TAKE COLOUR PHOTOGRAPHS

Think of it — blue sky, green grass, yellow sands, gay frocks of varied hues — all the brilliance of summer can now fall captive to your camera. Dufaycolor brings natural colour photography within the scope of every camera user. You need no special apparatus, and the extra cost is trifling. Lovely transparencies in natural colours can be yours without the use of special filters, and Dufaycolor is just as easy to use as ordinary film.

DUFAYCOLOR

ROLL FILMS · FILM PACKS

Your photographic dealer stocks all popular sizes, including No. 27 ($1\frac{5}{8}\times2\frac{1}{2}$) Roll Film and No. 00 ($1\frac{3}{4}\times2\frac{3}{8}$) Film Pack.

Get a copy of **"The Dufaycolor Process"** from your dealer, price 6d., or from Ilford Limited, post free 8d.

TOPICS of the Week

WE can safely claim intimate and up-to-date knowledge of the ideas and activities of the amateur photographer. Our finger is constantly on his pulse. Yet we have detected no sign that he has been daunted by the weather, about which scathing remarks have been made on all sides from day to day and month after month. Unabated has been the flow into our office of entries for competitions, prints for criticism, letters, articles, and questions on every possible and impossible phase of photography. Weather or not, the amateur carries on steadily and sturdily. The "bright intervals" occasionally foretold and sometimes realised he uses to full advantage; the more frequent "depressions" he regards merely as providing opportunities for different kinds of work indoors or out. His enthusiasm carries him on, come sunshine or rain, from January to December, and we cordially wish him all the good fortune he deserves.

The Camera at the Olympic Games.

Photographs—and stereoscopic ones, too—have played a conspicuous part in the Olympic games at Berlin. During the first two days a couple of events had to remain undecided until the photographs were developed. Not only the end but the beginning of each event has been photographed, the crack of the starting pistol automatically releasing the shutter. Judgment which turns upon split seconds is too delicate a matter to leave to the unaided eye, and the camera must be the final umpire. Even the camera, of course, can lie, and it would be child's play for anybody to make a picture in which the loser appeared to be the winner, but with stereoscopy this would be more difficult, and with rigidly controlled conditions quite impossible. What a pity it is that photography was not going during those events in ancient Athens. Had such records been available we should probably have quite different ideas about Greek athleticism. We should know whether some of the poses in the old statues are true or the artist's convention. They had not even any timing devices in the old classical games, and we shall never know how the Greek runners compared with the negroes in the German stadium. But the race in those days, as at present, must have turned upon infinitesimal time, and there is more than a possibility that the laurel sometimes wreathed the wrong brow.

THE COAST-GUARD.

See article on "Variety in Holiday Snapshots" in this issue.

Angles and Pyramids.

The craze for taking photographs at unusual angles grows apace. Or, perhaps it should rather be said, the greed of editors of illustrated papers for such photographs is unappeased. The news films in the picture houses show sporting and other events now as seen by the eagle from its eyrie, and then as seen by the rabbit from its burrow. There are right angles, acute angles, obtuse angles, everything is where you don't expect it to be, every picture a puzzle picture, scale and proportion are of no account, and it takes you a full minute to decide whether a given subject is a toothbrush or a seaside pier. Hogarth, in his "Analysis of Beauty," declared that the painter if left to his choice "takes it on the angle rather than in front," but the camera, with its unusual opportunities for angle views has carried it beyond the

wildest Hogarthian dream. Some day, perhaps soon, we shall find on the picture page a piece of work which staggers us by its unusualness —something we only dimly remember to have seen before. It will take us some moments before we realise that this is indeed a photograph of something taken in the ordinary way, at normal eye-level, without twist or obliquity or any such thing. There are those who say that the best thing about wireless is the joy of silence when it leaves off; and certainly we have reason to be grateful to eccentricity in art, because it makes the normal appear so enjoyable when we see it.

Seeing Below Water.

At the recent British Medical Association meeting in Oxford we were handed a pair of spectacles which gave us that much coveted thing, a new outlook upon the world. Some people are said to have rose-coloured spectacles, but what seems more desirable is to have spectacles which can get below the surface shine of things and enable us to see the world without annoying and deceptive reflections and shimmerings and surface brightness. These were fitted with polarising filters to cut off haze and glare. Were we fishermen? Then they would enable us to see the bottom of the pond, granted, of course, that the water was reasonably clear and not ruffled by wind. Were we motorists? Then we should have a much more comfortable view of the white road, without being troubled by reflections from it. Were we frequenters of picture galleries? Then we should be enabled to see the paintings without having to squint and get academy headache owing to the reflections in the glass. But what pleased and satisfied us most was just to put on those glasses and gaze out over the towers and spires of Oxford. It was an interesting little lesson in tone values, and the scene had a peaceful aspect.

The Comic Strip in Colour.

It was a sheer delight to see, in a London picture theatre the other evening, an example of the Gaspar colour process applied to the "Mickey Mouse" types of subject. It was a colour version of "Ali Baba and the Forty Thieves," and certainly colour gave to such a piece of work a rich realism.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Flare in Lens.

I am told that the curious effect in the enclosed print is due to a defect in the lens known as "flare." As the lens is a new and expensive one I feel perturbed. To what is the defect due? Can it be remedied, or must I regard the lens as unsatisfactory?
C. M. (Putney.)

We have not reproduced the print you sent, but another one with a very similar effect, as we feel convinced that in your case, as in this, the trouble is not due to the lens at all. The defect in the print here might reasonably be attributed to a hole in the bellows; but it is the result of a pair of spectacles being laid on the rock. The sun caught these, and the glare of light was reflected into the lens.

If you examine your own print you will see that the light patch roughly corresponds with one of the row of windows at the top of the building, and the direction of the lighting indicates that the sun was reflected into the lens from this window. The effect must have been visible to the eye, although you probably did not notice it.

It is quite a common thing to see a brilliant reflected light of this sort, even miles away. The system of heliograph signalling was based on the sun's light being reflected from a movable mirror. Familiar, too, are the brilliant spots and patches, often irregularly diffused, reflected from the sun's track on the sea.

Genuine flare is more common with some types of lenses than with others, but it may occur even with the best modern anastigmats. The bright object causing it may or may not be included in the picture, but its image on one surface of the lens may be picked up by reflection on to another surface, and thence projected on to the negative. A bright lamp, for example, may be correctly reproduced on the negative, while at the same time a "ghost" image of the lamp may appear in another part.

The conditions for producing visible flare with modern lenses are by no means common. In your case there is no need to be perturbed, as the trouble your print shows would have occurred with any lens in the same circumstances. The glare of reflected light was there, and naturally the lens recorded it. The lesson to be learnt is to keep a watchful eye for similar conditions.

Gaslight Developer.

Will you give me a good all-round developer for gaslight paper? I should like one that will keep in good condition for a reasonable time. *R. J. J. (Chelmsford.)*

We always advise the use of a formula recommended by the makers of the particular paper in use, but the following will give good black tones on most gaslight papers.

Metol	8 grs.
Hydroquinone	30 grs.
Sodium sulphite	¾ oz.
Sodium carbonate	¾ oz.
Potassium bromide (10 per cent)	20 drops
Water	10 oz.

The unused solution will keep well in a properly corked or stoppered bottle just large enough to hold it.

With correct exposure, and a temperature of about 65° Fahr., development is complete in 20 seconds or so. If it takes much longer it is an indication that a longer exposure is necessary.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Ensuring Sharp Definition

In these days of small negatives, printed by enlargement, sharp definition is of the greatest importance. In this article some of the factors which affect the definition of negative or print are dealt with.

THE subject of definition is an important one for every photographer. It is true that it is sometimes desirable for diffusion of the distant planes in the case of pictorial photographs, but it is generally necessary that the principal planes should be sharp.

It is possible to introduce any diffusion that may be thought necessary when printing or enlarging from a negative that is too sharp for pictorial effect, but it is impossible to counteract the result of poor definition in the first place.

Sharp definition is of the greatest importance to the user of the miniature camera who intends to produce prints of large size, and it is equally important to the user of larger apparatus who also makes his prints by enlargement.

Lens and Camera.

The first point concerns the maker of the lens and its fitting to the camera. Standards of definition vary, but it is safe to assume that the lens, if it bears the name of a maker of repute, will give a sharply defined image over the whole of the negative that it is listed to cover. Apart from the subject of depth of focus, which is outside the scope of the present article, the lens should give a sharp image of the subject for the point upon which it is focussed. In many modern cameras accurate focussing is assured by the range-finder system, and in older types by examination of the image upon the ground glass.

When the actual image is not seen, the focussing being done by scale, there are other points that have to be given consideration. The focussing scale must be accurate with regard to the lens, not only for the infinity point, but for each distance engraved upon the scale. We have known of cases where the one may be correct, but serious inaccuracies displayed with regard to other distances.

In the case of a new camera the scale may be taken for granted, but in the case of one that has had some use it is possible that the scale may have moved slightly, or it may be that the lens and shutter have been removed, and upon reinserting have not been returned to the same position. A few turns of a screw thread will be quite sufficient to affect the definition of a large-aperture lens.

In the case of a plate camera it is necessary that the "register" of the focussing screen and the plate-holder or the film in the adapter is the same. This is especially important when new plate-holders, especially by another maker, are added to the outfit.

In the case of a film camera flatness of the film is of the greatest importance. This latter is assured in the case of a modern camera by means of a pressure plate, but in the case of some of the older models this is not fitted.

The camera should be rigid. By this we mean that all moving parts function with firmness, while not unduly stiff. A lens front that does not hold the lens firmly is almost certain to produce negatives that are poorly defined.

The Personal Factor.

The most perfect optical equipment, fitted to the most perfect of precision cameras, can fail to produce sharp negatives if the photographer fails to ensure that the camera is steady at the moment of exposure. Many negatives that appear sharp to the eye fail to reach the standard of definition when enlarged, and this is almost always due to the fact that the camera is not steady at the moment of exposure.

In spite of the fact that an exposure may be a very small fraction of a second, it is necessary that the camera should be still, or the definition of the negative will be affected. If a cable release is used to operate the shutter it should be of fair length; the short, stumpy release is likely to cause camera movement.

A point that often escapes attention is the need for a rigid tripod. Many tripods are flimsy with regard to construction and unsuited to all but the lightest cameras.

Another cause of poor definition, and one that is often unsuspected, is that the lens is dusty, or covered with a film deposited by exposure to damp or salt-laden air, or smoky atmosphere. A dusty lens can also produce the same effect.

Enlargements.

Many enlargements that are made from sharp negatives exhibit defective definition. Provided that the lens is of first-class optical quality, and properly adjusted in the apparatus, there are several possible causes. The baseboard may not be parallel with the negative and the lens. As with the camera, the lens may be dirty. There may be movement of some part of the apparatus during the exposure, and especially if the apparatus is arranged upon a table or bench which is not very rigid, while the easel is capable of independent movement. In such cases it is very necessary for the worker to refrain from movement during the exposure.

A further cause of imperfect definition may be that the paper is not flat. If the paper is kept under pressure by a glass plate, care must be taken to see that the surface is clean on both sides.

It is evident that when it is found that a negative has definition that does not come up to the required standard, the cause may be one or more of those mentioned. The next step is to investigate them one by one, eliminating those that obviously do not apply, until by a process of exhaustion the cause of the trouble is identified.

The GENESIS of an Exhibition Print

Simple Steps that make the Picture.

By L. GORDON PAULE.

LUCKY is the man who can secure a negative which, by perfectly straight printing, will give him a print really fit to take its place in an exhibition.

Only too often is it the case that some sort of manipulation is necessary when preparing the final print in order that it shall bear out our conception of the theme as we wish it to be seen, and especially is this the case in the summer months, when brilliant sunshine and a combination of other circumstances over which we photographers have no control tend to give us negatives which are too hard and brilliant.

Softness is a quality which is decidedly difficult to catch when there is a brilliant sun beating down upon the subject one wishes to photograph, and very often it is quite impossible to attain it direct upon the negative without resorting to such things as soft-focus lenses.

And, again, we all know that a scene which strikes us as being beautiful enough to our eyes is often slightly disappointing when we see the finished print of a photograph of it. Somehow, the balance and composition which appeared perfect as we viewed the scene seem to take on a different aspect in the print, and it is not always easy to give a reason.

How many times, for instance, have you taken photographs of scenes like that shown in Fig. 1, and felt, after making an enlargement, that it does not seem the same as when you saw it? In itself it is quite passable, yet there is something about it which causes it to fall below expectations.

Fig. 1. The original print.

First and foremost is the unnecessary amount of detail which creates in the picture a "spotty" quality which is not restful to the eye. Something must be done to remedy this, and fortunately it is a very simple matter. A thickness or two of fine chiffon over the lens of the enlarger will give a result which is infinitely softer, but which, even so, will retain all the detail necessary.

Yet even this does not give the impression which was created when the picture was taken—there is something wrong—something out of place, which, despite the definite "leading in" to the picture which the narrow path creates, causes the eye to wander restlessly from one side to the other. What is it? And how can it be remedied? Once again the answer is simple—it rests entirely upon a psychological point. When we read a book our eyes travel from *left to right*, and, unconsciously, when we look at a picture such as this, they want to do the same, unless there is a very strong motive present to draw them in the other direction.

In the picture before us—which is typical of thousands taken on holiday every year, our eyes constantly seek to travel in the opposite direction to that in which the path leads.

The remedy, therefore, is perfectly obvious—*reverse the picture* by reversing the negative in the carrier. That is to say, instead of the emulsion side facing the bromide paper, the negative is placed in the carrier so that the glass side is towards the easel.

So far so good. The eyes now travel quite easily along the path in the direction of the girl.

But we still have something which causes a distraction—obviously there is too much in the picture altogether, particularly too many patches of white sky. Judicious trimming is the next step, which leads us to Fig. 2.

Fig. 2. The exhibition print.

Now compare this with the original straight print in Fig. 1, and notice the difference. There is still plenty of essential detail visible, yet it is not so blatant or harsh. And the interest is definitely centred now on one spot, to which the eye naturally comes to rest without undue wandering.

It is surprising that more use is not made of a little chiffon and the little trick of reversing the negative—but these expedients must not be looked upon as remedies for all defects, and, simple as they are, great as are the improvements which can be made by their use, great care is needed in order to retain the characteristics of the theme itself.

PLAIN ADVERTISEMENTS

The other day a customer asked us why we do not as a rule enliven our advertisements with illustrations.

In case readers of *The Amateur Photographer* may have gained the impression that we do not appreciate art, or something of the kind, we hasten to make known our reason for this abstention. The fact is we assume that by now most keen amateurs know what the Leica and the Contax look like. On the other hand, we agree that quite a number of specialised accessories for these cameras are not so generally familiar—but even if we wanted to illustrate a fair percentage of these, it would mean our taking up a whole edition of *The Amateur Photographer* to do so.

In the circumstances we are afraid that we shall have to fall back once again on unadorned statement: We stock every miniature camera of repute. Besides the cameras themselves, we have about 500 accessories for the Contax and a similar number for the Leica. We also stock every accessory for the Rolleiflex, Exakta and Super Ikonta. Of special fine-grain developers we keep every variety at present available in Great Britain. Our stocks of miniature films are replenished fortnightly to ensure the absolute freshness that is essential if these films are to retain their maximum speed and fineness of grain.

IT HAS COME TO OUR NOTICE THAT WELL-KNOWN MAKES OF MINIATURE CAMERAS—PARTICULARLY VERY RECENT MODELS—ARE BEING OFFERED TO THE PUBLIC, THAT HAVE NOT BEEN OBTAINED THROUGH THE ORDINARY RECOGNIZED CHANNELS OF SUPPLY. CONSEQUENTLY, THESE CAMERAS ARE FOR THE MOST PART SCALED IN METRES, AND, HAVING BEEN INTENDED FOR THE CONTINENTAL MARKET, HAVE CONTINENTAL-SIZE TRIPOD BUSHES.

WE TAKE THIS OPPORTUNITY OF STATING THAT ALL OUR NEW CAMERAS ARE OBTAINED THROUGH THE LEGITIMATE MANUFACTURERS' AGENTS, ARE PROPERLY SCALED FOR THE ENGLISH MARKET AND CARRY THE FULL MAKERS' GUARANTEE IN THIS COUNTRY.

WITH EACH OF THE SECOND-HAND CAMERAS LISTED BELOW WE GIVE A WRITTEN GUARANTEE OF MECHANICAL AND OPTICAL PERFECTION.

LEICAS:

Leica Model IIIa, fitted latest pattern rectilinear focussing f/1.9 Hektor. Unsoiled in any way £45 0 0
Leica Model IIIa, f/2 Summar lens, ever-ready case. As new..... £34 10 0
Leica Model III, black, f/2 Summar lens, ever-ready case. As new..... £31 10 0
Leica Model III, black, f/3.5 Elmar lens, ever-ready case. As new..... £23 17 6
Leica Model II, black, f/3.5 Elmar lens. Excellent condition..... £18 10 0
Leica Model II, black, f/2.5 Hektor lens. As new..... £21 10 0
Leica Model I, f/3.5 Elmar lens, interchangeable. Excellent condition..... £10 10 0
Leica Model I, f/3.5 Elmar, non-interchangeable. Good condition..... £7 18 6
Leitz f/3.5 Elmar, 3.5-cm., coupled, nickel..... £6 7 6
Leitz 5-cm. f/3.5 Elmar, coupled, nickel..... £6 7 6
Leitz 13.5-cm. f/4.5 Elmar, uncoupled. In good condition £7 5 0
18-cm. f/5.5 Tele-Megor, coupled for Leica with special finder. As new.... £18 15 0
Leitz Stereo Viewer..... £5 5 0

Sump Lens Hood, 8s. 0d. Self-timer, 7s. 6d. Spool Chambers, latest pattern, 6s. 6d. each; old pattern, 4s. 6d. each. Adjustable Lens Hood, 12s. 6d. Slow Speeds Attachment, £2 2s. Latest Pattern Panorama Head, 13s. 6d. Fipos Filters, 14s. 6d. each. Figro and Figam Filters, 12s. 0d. each. Angular Finder for Model I, 15s. 0d. Short-base Range-finder, black, 27s. 6d.

CONTAXES:

Contax Model I, wedge-type range-finder, f/1.5 Sonnar lens, ever-ready case. As new £42 10 0
Contax, as above, but with f/2 Sonnar lens..... £32 17 6
Contax, as above, but with f/2.8 Tessar lens..... £25 17 6
Contax, as above, but with f/3.5 Tessar lens..... £23 17 6
Contax, as above, but fitted earlier type range-finder, with f/2.8 Tessar lens.. £23 10 0
With f/3.5 ..... £21 10 0

The following Telephoto Lenses will fit either Models I or II Contax:—
Zeiss 8.5-cm. f/2 Sonnar lens. As new..... £26 10 0
Zeiss 12-in. f/8 Tele-Tessar, with filter and special case. Cost £48. As new £30 0 0
Contax Plate Back, £3 5 0. Extra Slides, 5s. 6d. each. Contax Magniphot Enlarger, to take lens from camera. Excellent condition, £6 17 6.

MISCELLANEOUS:

Contaflex, f/2 Sonnar lens, ever-ready case. As new..... £55 10 0
Latest 6×6 Automatic Rolleiflex, f/3.5 Tessar lens, Rapid Compur, ever-ready case. As new £20 10 0
Latest 4×4 Automatic Rolleiflex, f/2.8 Tessar, Rapid Compur, case. As new £21 10 0

MISCELLANEOUS—contd.

Automatic 6×6 Rolleiflex, f/3.8 Tessar, Compur, ever-ready case. Excellent condition £16 15 0
Automatic Rolleiflex 4×4, f/2.8 Tessar, normal Compur, ever-ready case.... £17 10 0
Rolleicord, f/3.8 Triotar, ever-ready case. As new..... £11 17 6
Exakta Model A, f/3.5 Ihagee anastigmat. Good condition..... £11 10 0
Exakta Model A, f/3.5 Tessar. Excellent condition £13 17 6
Exakta Latest Lever-wind Model A, f/2.8 Tessar, case. As new..... £19 10 0
Multispeed Exakta, f/1.9 Dallmeyer Super-Six, extension tube, lens hood, universal case. Excellent condition £26 10 0
Voigtlander Superb, f/3.5 Skopar. As new..... £11 17 6
Ikoflex Model II, f/3.5 Tessar, Rapid Compur, case. As new..... £16 17 6
Latest Improved Model Korelle, f/3.5 Tessar, ever-ready case. As new.... £14 15 0
Baldax, 16-on-3½×2½, f/3.5 Trioplan, Compur. As new..... £5 15 0
Baldi, 16-on-V.P., f/2.9 Trioplan, Rapid Compur. As new..... £6 10 0
Kodak Nagel Pupille, 16-on-V.P., f/2.8 Tessar, Compur, ever-ready case. As new £12 15 0
Kodak Nagel Pupille, f/3.5 Elmar lens, Compur, special reflex attachment. Excellent condition..... £12 15 0
Nagel Rolloroy, f/2 Xenon lens, case. Excellent condition..... £10 15 0
Dolly, f/2 Xenon, Compur. As new..... £8 15 0
Miniature Marvel, f/2 Xenon, Compur. As new..... £8 17 6
Weltur, 16-on-3½×2½, f/2.8 Tessar, Compur shutter, coupled range-finder combined with view-finder. As new..... £17 15 0
Zeiss Super Ikonta 530, f/3.5 Tessar, case. As new..... £13 10 0
Zeiss Super Ikonta 530/16, f/3.5 Tessar, Rapid Compur. As new..... £19 17 6
Zeiss Super Ikonta 530/2, f/3.8 Tessar, Rapid Compur, ever-ready case. Cost £24. As new £19 10 0
Fotet 3×4 cm., f/3.5 Trioplan, Compur, purse. Excellent condition £4 17 6
Piccochic 3×4 cm., f/2.9 Vidanar, Compur..... £4 7 6
Foth-Derby, f/2.5 lens, Compur. Good condition £5 12 6
Exakt Enlarger, Model IIa, for 6×6 cm. negatives. As new..... £15 15 0
Retina, f/3.5 Xenar, Compur, case. As new..... £6 17 6
Minifex, f/3.5 Trioplan, Compur..... £5 15 0
Welta-Perfecta, f/3.5 Trioplan. As new..... £12 17 6
Ikoflex Model I, f/6.3 Novar, Derval shutter. New condition..... £4 17 6
Zeiss Super Ikonta 530/16, f/2.8 Tessar, ever-ready case. As new..... £23 17 6
Zeiss Super Nettel, f/2.8 Tessar, case. As new..... £17 15 0
Multispeed Exakta, f/2.8 Tessar, case. As new..... £21 10 0
Plaubel Makina 3½×2½, f/2.9 Anticomar, 3 slides, F.P. adapter, case. As new £28 10 0

Voigtlander Virtus, f/3.5 Heliar, Compur shutter. As new..... £8 5 0
Super Nettel, f/3.5 Triotar. As new..... £13 17 6
Rolleicord Model I, f/4.5 Triotar, case. As new..... £8 10 0
Plate Back, 17s. 6d. Plate-holders, 11s. 6d. each. Lens Hoods, latest type, 11s. 6d. each. Lens Hoods, old type, 5s. 6d. each. Panoram Head, 13s. 6d. Stereo Attachment, 17s. 6d. Rolleipar, 14s. 6d. Iris Stop, 17s. 6d.

EXPOSURE METERS

Avo Model I, with case, 28s. 6d. Ombrux Meter, £2 2s. Photoscop, 47s. 6d. Weston, Model 617, £2 7 6. Sixtus, latest type, £4 7 6. Weston Model 627/2, £2 17 6. Weston Leicameter, Model 627, £1 15 0. Zeiss Helios Meter, £3 5 0. Tempophot, £2 2 0.

PART EXCHANGE ON MINIATURE CAMERAS

As specialists, we are in the position, where miniature cameras are concerned, to pay the highest cash prices and to give exceptionally generous allowances in part exchange. Why not call or write for a quotation?

R. G. LEWIS, The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1
(HOLBORN 4780) (Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

IMPORTANT

All Zeiss Ikon Cameras sold by us in Great Britain are equipped with distance and depth-of-focus scales in English feet. Also diaphragm scales are engraved according to the R.P.S. standard.

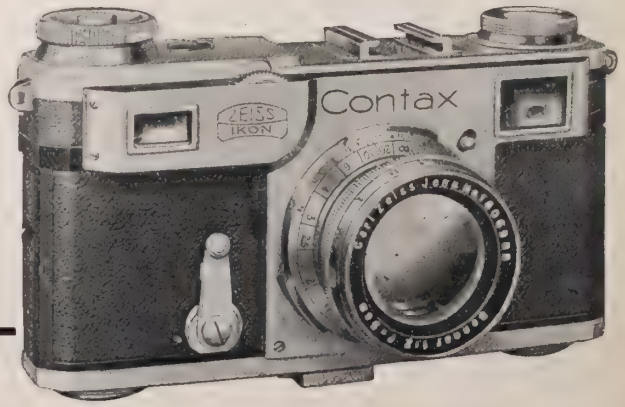
ZEISS IKON

"... . Quite a bright idea combining the distance meter with the view-finder in the Contax II."

"Yes, just look through this little window. It is the view-finder, and in the centre you can see the secondary image of the distance meter. And it is not a question of compromise—actually both distance meter and finder image are superior to previous models."

"I see—that's fine."

"It's much better having the larger field of view when focussing, and you don't have to waste any time shifting the eye from one peep-hole to another. And think how much easier it is being able to follow the subject and focus it at the same time."



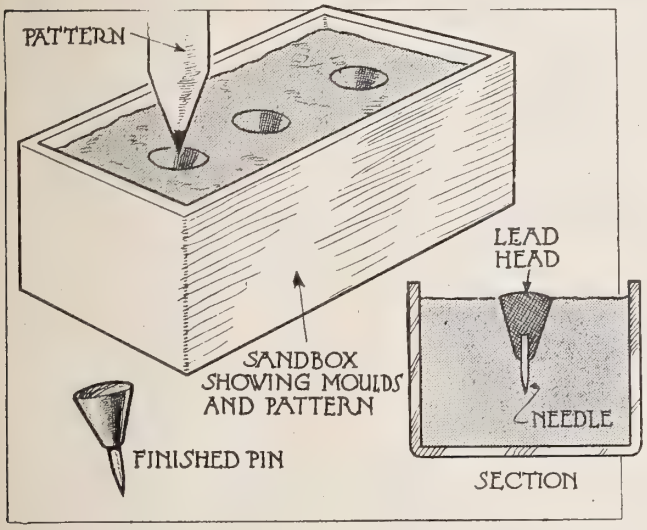
"Just so! It looks rather a jolly little job, this Contax II, and it almost seems to be smaller."

"That is because the corners are chamfered. You will find it easy to hold steady, all the controls are on top of the camera, and the shape is beautiful."

"I see the shutter gives a 1/1,250th second, so it's certainly the camera for rapid subjects."

And indeed for all branches of photography, including fast speed work, night photography with the ultra-rapid Zeiss Sónnars f/1.5 or f/2, and photomicrography. Besides all this, the delayed-action release enables the photographer himself to appear in the picture, so the Contax is truly the universal miniature camera.

Those desirous of further particulars are invited to ask their local dealer for a demonstration. Name of nearest stockist, together with full particulars, free on request. 96-page General Catalogue for 3d. in stamps.



CONTAX II

ZEISS IKON LTD., 11, Mortimer House, Mortimer Street - - London, W.1

Readers' Hints, Tips and Gadgets

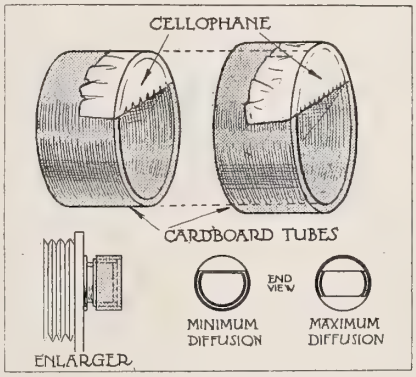
A USE FOR WORN GRAMOPHONE NEEDLES.

THE disposal of worn-out gramophone needles, like razor blades, is a bit of a problem, but I have made good use of some, at any rate, by converting them into photographic "thumb tacks" which are useful for pinning up prints and films to dry, fixing the bromide into position on the enlarging easel, and for many other purposes.

The method is simple, as shown in the attached sketch. First of all, fill a small box or tin with fine silver sand, slightly moistened, and press it down firmly. Then make a series of depressions by pushing in the point of a carefully-sharpened pencil, or a propelling pencil. Then drop a gramophone needle into the bottom of each, point downwards, so that half the length sticks up into the mould cavity. Fill each cavity to the top with molten lead (old tooth paste tubes, if you like) and allow to set and cool.

The result is a stout pin with a fine point, and a head giving plenty of area to push on.

If the needle shanks can be slightly marked by squeezing them with cutting pliers they will be found to hold in the lead better, and will help to prevent them from coming away should they happen to be pushed too hard in the easel, shelf, etc.



Although only three moulds have been shown in the illustration there is, of course, no limit to the number, provided they are not too near each other.

G. F. PONTING.

DIFFUSION CONTROL FOR ENLARGERS.

THE chief drawback to most of the more usual enlarging diffusing devices of chiffon, diffusing lenses, etc., is that the exact degree of diffusion cannot actually be seen before the exposure is made. The following easily constructed gadget overcomes this difficulty.

Two short cardboard tubes are required, about ½ to 1 in. long, the one being a loose fit over the other, and the smaller a tight fit on the enlarger lens mount. A piece of clear white Cellophane used for cartons is pasted over one end of each tube to cover about a third of it, as shown in the illustration. The smaller tube is fitted to the lens and the larger one slipped over it. By rotating the latter, a greater or smaller area of the lens is covered and the degree of diffusion controlled accordingly. Greater diffusion still may be obtained by slightly crinkling the Cellophane and then smoothing it out again before fixing.

If the Cellophane is soaked in water first and then gently placed into position and glued on the tubes it will be stretched taut when dry.

The same idea can, of course, be adapted for camera lenses, especially where the preliminary focussing can be carried out by ground-glass inspection.

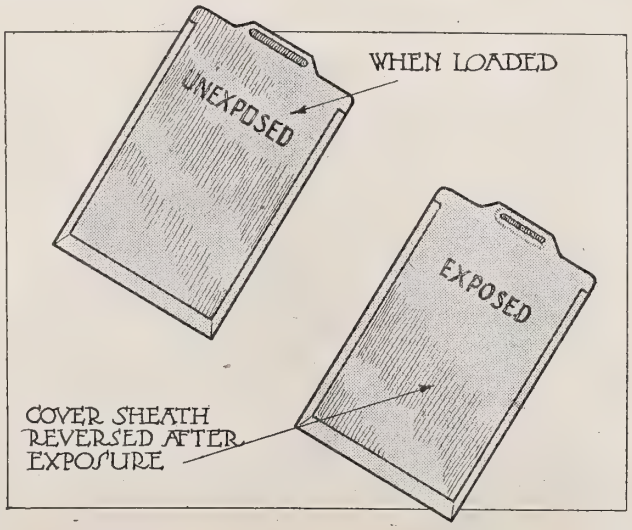
This type of diffuser tends to decrease the tone contrast, and is very suitable for contrasty subjects and negatives.

H. BARLOW.

A PLATE-HOLDER HINT FOR PREVENTING DOUBLE EXPOSURES.

THERE have been many different devices for preventing double exposures when using plate-holders, but the following method described is both simple and does not require additional fittings.

It consists simply of marking on both sides of the cover sheath that has to be withdrawn each time an exposure is made. One side of the sheath should be inscribed "Unexposed," while the other side is marked "Exposed."



It is immaterial if it is painted on or scratched on, but so much depends on the material, whether it is ebonite, aluminium, or painted black. It is not advisable to paste on a label as it will sure to be scraped off later.

After the slide is loaded, the sheath is inserted showing "Unexposed" outside, and when the exposure has been made the slide is reversed on replacing it.

The most important thing to be considered before any marking is made is that the sheath can be reversed while the slide is in position in the camera, as sometimes the embossing at the head of the cover sheath prevents this reversal.

A good tip to remember is that the cover sheath should not be replaced when the slide is empty, but is better laid on the outside and kept in position in an envelope or by a rubber band. This prevents the pile in the light trap being pressed down unnecessarily.

MISS G. STILTON.

VARIETY

By W. PYE.

Swapping yarns while business waits.

KEEN photographers set great store on their annual holiday for providing fresh pictures in new and unfamiliar scenes. Others, under the spirit of *laisser-faire* that holidays generate, are content with indiscriminate snapping of friends and places.

The writer is often given the privilege of looking through holiday snapshot albums, and the "sameness" of the subjects taken is amazing considering the picture possibilities of the places visited. The majority consist of distant views of mountain ranges, or cliff and seashore, with an occasional portrait where "her young man" is sitting on a ledge of rock or park seat, and she gives him her best smile for a return exposure. These, no doubt, bring pleasure, and have their place in holiday records, but the interest of the album can be considerably increased by a wider outlook of holiday experiences. It is granted that some places offer greater scope than others, but observation, alertness for unusual scenes and incidents, and *originality to make* pictures as well as find them, will add a spice of variety to the holiday record.

For instance, a pier jutting out into the sea is banality itself, but a careful viewpoint of some of its supports and anglework, with reflections in the wet sand, can change the banal into the beautiful, with the added satisfaction of seeing a commonplace subject from a fresh angle.

An expanse of sea dotted with boats in the distance is pleasant to the eye, but disappointing in a photograph, whereas a single ship sailing majestically into harbour under canvas, occupying a fairly large portion of the picture, becomes much more interesting.

A distant range of mountains, no matter how charming to the eye, cannot be adequately rendered without some strong foreground to give scale and contrast.

These typical examples serve to warn the holiday photographer not to be caught by the glamour of distant

Carting sand.

Waiting for the train.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

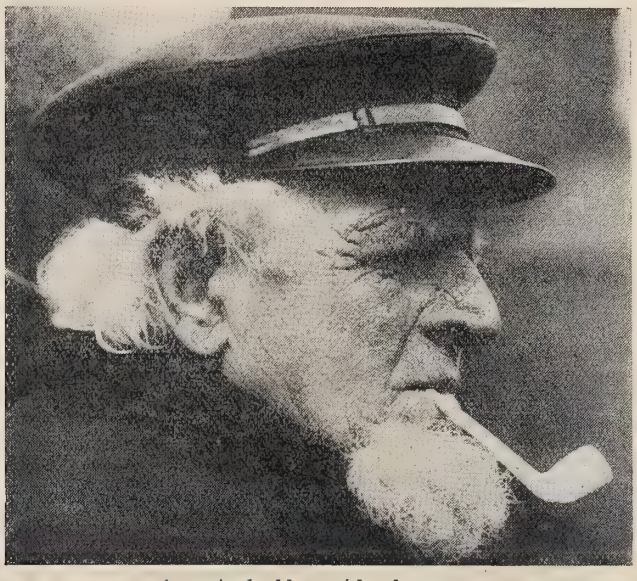
in HOLIDAY *Snapshots*

views, but to look for those that are near at hand, occupying a reasonable proportion of the film or plate, and rendering something of immediate interest.

Snaps with the human element included can be made more interesting by avoiding camera-consciousness. Action is the secret. Get the interest centred in some appropriate performance rather than the click of the shutter.

An early morning canter on the sands.

Homeward with the catch.



Every holiday centre has a characteristic of its own, and this is a good starting point to work from. Guide books and local postcard views will give a clue to this. But there is need to be on guard against the lure of the commonplace scenes that are new at first sight in a strange place. It should be the aim to express personal impressions of these features rather than slavishly follow the hackneyed views that are so common.

Bearing these suggestions in mind, it matters little whether the place be noted or obscure, sufficient diversity can be found to make a holiday record of real value to oneself, and pleasure to all who inspect it.

It is not to be expected that this gift of "spotting" fresh and original subjects, or achieving a new version of old ones, can be called into action at a moment's notice. It is no use striking an attitude, and saying, "Henceforth I will be original." That is easier said than done.

The gift must be cultivated. Not only at holiday times and in strange places must we learn to use our eyes and our wits, but at all times and everywhere. We must learn to look at things in our own way, and to study them in our own minds. Such variety and interest as we are able to secure in our snaps will then be original and personal. We shall do more harm than good by blindly imitating the ideas and views of other people.

It would be a pity if we miss some of our striking subjects through technical defects, and that is why it is always risky on a promising holiday to try new apparatus or materials. We should be wiser to keep to what is familiar to us, and leave experiments for less important occasions.

A typical old seaside character.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

The annual international ciné competition organised by the Institute of Amateur Cinematographers, of Burley House, Theobalds Road, London, W.C.1, to discover amateur talent, is closing on September 30th. Entries are invited from all countries from both members and non-members. No fewer than twelve awards are offered for all films of all classes and subject matter. Full particulars and entry forms are to be obtained on application to the Hon. General Secretary, Mr. Wm. E. Chadwick, at the above address.

The next Southern Railway ramble to include the photographic party will be on Sunday next, August 16th, to Bentley, for the heather-clad views round Frensham Ponds. The special train leaves Victoria at 9.30 a.m. and arrives back at 9.17 p.m. Return fare, 3s. 6d. Leader, Mr. A. E. Daly.

A very interesting and instructive series of four booklets, each dealing with a different subject in photography, written specially for the beginner, are now available at 1s. 3d. each, or 4s. 6d. the four, post free, from Messrs. Sands Hunter & Co., Ltd., 37, Bedford Street, London, W.C.2. These books, which are translated from the German, are written and illustrated by specialists in their line, and take for the most part the form of brief and concise questions, answers and facts. No. 1, "A Good Picture Every Time"; No. 2, "Sharp Focus, Accurate Exposure"; No. 3, "130 Photo-Faults," and No. 4, "Taking Pictures at Night."

For many years photographic clubs have been linked together in associations, while postal portfolios have continued to operate as individual bodies. At last a move has been made to draw at least a number of these into federation under the style of "The Association of Postal Portfolios." The movement originated with the "Photographic Miniature Postal Portfolio," which introduced eight circles, the "Photographic Postal Portfolios" introduced two circles, and the "Leica Postal Portfolios" another three circles. Thus, within a month of its inception the Association is thirteen circles strong, representing about 380 photographers. The scheme is likely, upon its present showing, to develop into a complete success. Particulars can be obtained from Mr. George A. Slight, 18, Ewelme Road, Forest Hill, London, S.E.23.

The latest winner of the Wallace Heaton weekly competition is N. G. Baguley, 11, High Street, Kenilworth, to whom an award of 21s. has been made. Particulars regarding this new competition will be found in our advertisement pages.

Readers owning vest-pocket roll-film cameras will be interested to know that Dufaycolor roll film is now available in that size, No. 27. Each spool contains sufficient for six exposures and the price is 3s. 4d. each, with a processing charge of 1s. 9d. If unobtainable from dealers, stocks are carried at Ilford Ltd., Ilford, London, and at 101, High Holborn, London, W.C.1.

A new branch shop of The Camera Company of 320, Vauxhall Bridge Road, London, S.W.1, is now open at 52, Cheapside, London, E.C.2. Stocks of all kinds of photographic apparatus and materials are carried, and readers are cordially invited to visit the special demonstration theatre for ciné apparatus.

A new soft-focus supplementary lens has just been put on the market. It is called the "Duto," and is used on any size of "still" and ciné camera. In appearance the "Duto" is apparently a circle of clear glass suitably mounted for attaching to the camera lens, but its surface is lightly impressed with a series of concentric circles. The effect of these is to produce a very pleasing "soft-sharp" effect that will appeal to many workers for portraiture and for some other pictorial subjects. Not only does this lens produce a "soft-focus" image, but owing to this quality it tends to produce a greater depth of field without the necessity of stopping down, and without affecting the speed in any way. In fact, the best results are obtained with the camera lens fully open. The "Duto" is made in two types—No. 1 for the majority of photographs where the light is shining on the subject, and No. 0 for "against the light" subjects. It is made in varying sizes to suit all lenses, from 14-mm. to 79-mm. diameter, and is supplied fitted in clip holders to fit the popular sizes of lenses, including those on the majority of miniature cameras. If a ground-glass focussing screen is used the "Duto" lens should be placed in position after the subject has been focussed. When a filter is employed the "Duto" should be fixed between the lens and the filter. It can also be used on the lens of an enlarger for diffusion purposes. The prices range from 11s. to £2 7s. 6d., and further particulars can be obtained from the sole distributors in this country, Messrs. R. F. Hunter Ltd., 51, Gray's Inn Road, London, W.C.1.

Stolen.—On July 16th a camera was stolen from one of our readers, Mr. W. Barreti, 12, Saville Road, Twickenham, Middlesex. The camera was a Zeiss Ikon Maxima camera, No. R.23918, with f/4.5 Tessar lens No. 1180998. If any reader can assist in recovering the stolen camera will he please communicate with Mr. Barreti at the above address.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, August 12th.

Blackpool and Fylde P.S. Peel and Ballam, Lytham Moss.
Bristol P.S. Avonmouth—Evening Ramble.
Leigh Lit. S. (Photographic Section). Mystery Ramble. J. Bolton.
Solihull P.S. Demonstrations: "Negative Development" and "Contact Printing." Miss D. Jarrett and M. White.

Thursday, August 13th.

Camberwell C.C. Demonstration—"Retouching."
Hammersmith Hampshire House P.S. "Some Photographic Odds and Ends, XIV."
N. Middlesex P.S. Alliance Competition Slides for 1935.
Oldham P.S. Evening Ramble—Parkbridge. W. R. P. Lees.
St. Helens C.C. Evening Ramble to Eccleston. Mr. Webster.

Friday, August 14th.

Sheffield P.S. Rivelin Post Office, 7.30. Mr. Taylor.

Saturday, August 15th.

Bristol P.S. North Stoke and Lansdown.
Hull P.S. Selby Abbey and Carlton Towers. J. A. Flucker.
N. Middlesex P.S. Outing to Victoria and Albert Museum. W. J. Allam.
Oldham Equitable P.S. Visit to Heaton Park. A. E. Petrie.
Rotherham P.S. Hickleton. J. Crowther Cox.
Sheffield P.S. Endcliffe and Whiteley Woods. Miss M. Harrison.
St. Helens C.C. Dean Woods and Gathurst. G. A. Forman.
Walthamstow and D.P.S. Windsor.

Saturday, August 15th (*contd.*).

Wolverton P.S. Buckingham and Water Stratford. A. Hodge.

Sunday, August 16th.

Beckenham P.S. Horsley, Shere and District. F. Garbutt.
British Photographic Fellowship. Beaconsfield.
Blackburn and D.C.C. Annual Picnic.
Derby P.S. Chee Dale.
Harrogate P.S. Fountains Abbey. G. A. Barton.
Leigh Lit. S. (Photographic Section). Fidler's Ferry. Mrs. W. Madeley.
Wood Green P.S. Outing—Chalfont and Latimer.
Woolwich P.S. Warwick. Mr. Nunn.

Monday, August 17th.

Oldham Equitable P.S. Portrait Night.
Southampton C.C. Informal.
Walthamstow and D.P.S. Outing Print Competition.

Tuesday, August 18th.

Hackney P.S. Prints by T. Y. Unwin.
Manchester A.P.S. "Artistic Mounting and Passe-Partout." H. Mills.
Whitehall C.C. Members' Evening.
Windlesham C.C. "Child Studies." Portfolio by Marcus Adams.

Wednesday, August 19th.

Southampton C.C. Outing to Cadnam. E. C. Lomer.

Miniature Camera Users!

Enlargements like contact prints

The new Selo films for users of Leica, Contax and similar miniature cameras, set a new standard for fineness of grain.

They yield enlargements notable for clear detail and a sharpness which is almost indistinguishable from contact prints.

SELO H.P. FILM

Fine Grain Hypersensitive Panchromatic

As fast as a fine grain film can be and remarkable for its fineness of grain. It enables difficult subjects with fast movement to be photographed with the certainty that well-exposed negatives capable of enlargement to great size will be obtained.

SELO F.P. FILM

Extra Fine Grain Panchromatic

Definitely the finest grain film produced and intended for the serious and exacting miniature camera photographer who wants perfect negatives of first rate enlarging quality.

These Selo Films are contained in a special Daylight Cassette of patented design which gives greater safety in handling, prevents scratching, and obviates friction.

Made in England by
ILFORD LIMITED
ILFORD, LONDON

SELOCHROME FILM

Special Fine Grain Orthochromatic

A splendid all-round film for almost every type of miniature photography by daylight. Anti-halo backed. For the photographer who wants a film of really fine grain at a low price.

For anything Photographic (Ciné or 'Still') GO TO THE WESTMINSTER

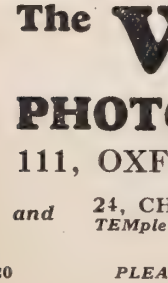
Genuine advantages in EXCHANGES and OUT-OF-INCOME Buying.

INCOMPARABLE "WESTEX" Roll Film Cameras

● Still Greater Demand!

"WESTEX Four-Five"

8 or 16 on normal 3¼ × 2¼ film. Very highest quality in every detail. Superb f/4.5 anastigmat, giving exceptionally fine definition, in focussing mount, delayed-action Prontor II shutter, 1 to 1/150th sec., T. and B. Sturdy all-metal body, plated edges, best leather covering and bellows. Quick self-erecting front. Optical direct-vision and brilliant waist-level finders. Hinged easy-loading back, panchromatic safety windows. Easy and delightful to handle, yet suitable for the most advanced work anywhere. By far the best all-round value offered. Obtainable only at the Westminster. **£4 : 8 : 9**



Nine monthly payments of 10/5.
Velvet-lined Leather Case, 6/9 extra.

"WESTEX Junior"

Takes 8 pictures 3¼ × 2¼ on standard film. Fine f/6.3 anastigmat in focussing mount. Self-erecting front, ready at a touch, direct-vision and brilliant finders. Quite unparalleled at its price..... **42/6**

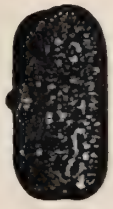
Nine monthly payments of 5/3.

'SIXTUS' Photo-Electric Exposure Meter for LEICA

Four times as sensitive as earlier models. Direct readings even in dark interiors. Most compact, with protective case securely fixed. Held by one finger. Measures only 2¼ × 2 × 1 in. Complete in case.

£5:5:0
Nine monthly payments of 12/3.

● 3 NOTABLE CINÉ OFFERS



KEYSTONE 750-watt 16-mm PROJECTOR

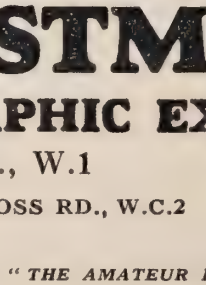
Greatest Value yet

2-in. large-aperture projection lens, motor drive, forward and reverse, Clarostat control, special still device, 750-watt lamp, super optical system for added brilliance, fin-cooled lamp-house. New improved double-claw action, screw tilting, geared rewind, simple threading. Complete with resistance, splicer and carrying-case, at phenomenally low price of..... **£36:10:0**

Nine monthly payments of 85/1.

KEYSTONE 8-mm. Cine Camera

Make a point of coming to see the new **Keystone 8-mm. Cine Camera.** Midget in size (slips easily into a coat pocket), giant in capacity—and as simple and economical as "stills." Weighs only 1 lb. 12 oz. Every necessary equipment, everything made easy. Quickly interchangeable lenses. Call at any of the "Westminsters," or write for list.

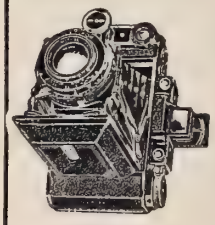


F/3.5 anastigmat, 3 speeds, direct-vision finder, visual footage indicator, exposure chart, etc., etc. **£10:10:0**
Nine monthly payments of 24/6.

F/1.9 Model. **£16:16:0**
Nine monthly payments of 39/3.

NEW MAGAZINE CINE-KODAK

Remarkable Production.



Charger loaded in 50-ft. 16-mm. film in 3 seconds. Film instantly interchangeable, e.g., Kodacolor to black-and-white, and vice versa, without any loss of footage. F/1.9 Kodak anastigmat, option of four telephotos 2 to 6 in., universal finder Ask for full description, or call and see. Complete in leather case

£40:0:0
Nine monthly payments of 93/4

NEW ZEISS IKON SUPER IKONTA II

Eight 3¼ × 2¼ or 16 2¼ × 1¼ on standard film.

All metal parts chromium finish; film winder and shutter interlocked, entirely preventing double exposures. Albada direct-vision finder, Tessar f/3.8, Compur Rapid delayed-action shutter, 1 to 1/400th sec.

£27 : 0 : 0

Nine monthly payments of 63/-.

NEW VOIGTLANDER BESSA—Built-in Range-finder

Takes 8 pictures 3¼ × 2¼ or 16 2¼ × 1¼ on standard 3¼ × 2¼ film.

New design baseboard, ensuring enhanced rigidity. Unique trigger release under baseboard. Yellow filter permanently attached in folding mount. Quick self-erecting front, depth-of-focus scale.

F/3.5 Helomar anastigmat, in delayed-action Compur shutter, 1 to 1/400th sec., T. and B..... **£16:10:0**

Nine monthly payments of 38/6.

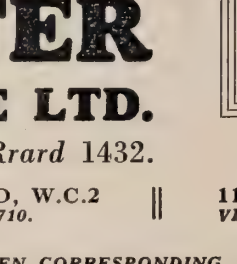
F/3.5 - Skopar anas., shutter as above..... **£18:15:0**

Nine monthly payments of 43/9.

F/3.5 Heliar anas., shutter as above ..... **£21 : 0 : 0**

Nine monthly payments of 49/-.

In latter model range-finder and view-finder are combined.



NEW DOLLINA (Coupled Range-finder)

This popular miniature is now fitted with most efficient coupled range-finder. Takes 36 on standard 35-mm. film. Safety winding prevents double exposures. Focussing can be set with camera closed. All-metal, leather covered.

F/2.9 Radionar, Compur Rapid, 1/500th **£14:12:6**
Nine monthly payments of 34/2.

F/2.8 Tessar **£18:18:0**
Nine monthly payments of 44/1.

F/2 Xenon **£19:19:0**
Nine monthly payments of 46/7.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXLVI.

Mr. R. W. A. BURGESS.

From information communicated to our Special Representative.

"ANY skill I may have acquired in the production of negatives and prints is due, in the first instance, to the careful training received from my father, who is as actively engaged to-day as when he opened his first professional studio over forty-five years ago.

"As I was born and lived within a few yards of a well-equipped studio it is not surprising that cameras, lenses, and all the paraphernalia connected with the profession and hobby, were commonplace and familiar objects to me from a very early age. Watching my father go about his business from day to day, I learned almost imperceptibly how to distinguish between an indifferent negative and one which is capable of yielding, under correct treatment, rich well-graded prints.

"There were others, too, who helped me on my photographic way; and among them I would mention the late R. Child Bayley, who published in 'The A.P.' my first essays in photographic journalism. He made the most of my illustrations, and occasionally wrote an encouraging letter.

"Those were the days when I lugged a triple-extension half-plate field set round the countryside, collecting studies of the local flora. That camera, a T.-P. Royal Ruby, has been with me, too, on more than one Alpine peak.

"My taste in cameras to-day is somewhat catholic. After exhaustive trials of numerous modern outfits, including the Kodak Six-20 Duo, the Retina, the Rolleicord, and several sixteen-on-V.P. size cameras, I am convinced that miniature cameras have come to stay. They are ingenious instruments, and are almost universal in their applicability.

"Nevertheless, at the moment, there are certain specialised branches of photography which seem to require a camera of somewhat larger dimensions. For animal portraiture a quarter-plate (or larger) reflex camera gives a rendering of the texture of fur and feather which is difficult of attainment with smaller outfits. My own reflex is a T.-P. Duplex Ruby. The lens is a Taylor and Hobson Cooke f/2.5 anastigmat of unimpeachable quality.

"The sensitive materials I use cover a very wide range for experimental purposes, but much of my more serious work is done on Ilford Soft Gradation Pan. plates, Verichrome, Panatomic, Selochrome, Selo Fine-grain Pan. films and packs. They are all thoroughly reliable materials, and give exquisite negatives.

"Exposures are on the generous side, and negatives are deemed satisfactory if (1) there is ample printable shadow detail, (2) high-lights are of such density as allows the print of a newspaper to be just visible when the negative is placed on it, and (3) the edges are clear.

"Exhibition prints are made on bromide paper. Kodak Royal, Ilford Lustre and Gevaluxe Velours I use extensively. Two enlargers are kept working full time—a horizontal condenser type for large negatives, and an Ensign Magnaprint for miniature negatives.

"Finally, I do quite a considerable amount of after-treatment on many negatives—with a coal hammer!"

(A further example of Mr. Burgess's work is reproduced on one of the centre Art pages.)

POLAR BEAR. *R. W. A. Burgess.*

Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"6.45 A.M.," by F. J. Mortimer.

QUITE remarkable, in this picture, is the feeling of illimitable distance. It conveys the idea of spaciousness to a degree that is very seldom equalled, and, at the same time, it suggests the glow of luminosity that is characteristic of the early morning hours as well as their innate atmospheric quality.

The sense of space owes not a little to the admirable suggestion of a real recession of planes arising from the differentiation of tones on the surface of the water. The darks and lights are most intense in the neighbourhood of the line of surf; these tones gradually lighten as they recede; they lose their contrast and become merged in a level evenness as they approach the horizon; and the horizon itself, instead of being shown as a hard, unbroken line, is lost and softened by the delightful rendering of distant atmospheric mist.

Above that band of misty distance glows the clearing in the sky. This is surmounted by a stretch of deeper tone suggestive of the evanescent veiling which disappears with the mounting of the sun, and, with the darker tone below, it combines to produce a fine impression of luminosity and light.

Point and emphasis is lent to both these abstract pictorial qualities by the presence of the diminutive group of bathers. Small in size though they be, they strike a note which is extremely powerful, and one which provides a strong centre of interest. Much of their forcefulness is attributable to their position, the group being placed almost precisely on one of the four intersections formed by divisions of thirds vertically and horizontally, and the importance so achieved is stressed and magnified by their intensity of tone, an intensity that cuts through the surrounding half-tone in a particularly vital fashion.

The group forms the keynote on which the composition is built up. In fact, it is the composition. It pulls the whole thing together and turns what would otherwise be a wide and uninteresting stretch of emptiness into an expression of space and light. It is extraordinarily well done. It will be observed, too, that the image is perfectly sharp and well defined, from which arises an impression of decision and effectiveness that is truly masterly, and one that indicates how futile and unnecessary is the introduction of any form of diffusion. Any such introduction, here, could only result in a lessening of the decisiveness which characterises the work, and with that would go most of its power.

Yet it is surprising to learn that the 20 × 16 original, which was shown at the last exhibition of the London Salon of Photography, was enlarged from a portion only—smaller than a postage stamp—of a negative taken with a miniature camera, so small, indeed, that, with the naked eye, the figures cannot be seen, and can only be identified with what are, to all appearances, just a collection of pinholes. Those who had the privilege of inspecting both could scarcely credit that the negative was responsible for the print; at least, until the former was examined under quite a considerable degree of magnification, whereupon the fact was established.

That such a result is possible is a tribute alike to the precision and versatility of the modern miniature camera and the material employed, as well as the technical and artistic skill of the author in bringing it out. In the first place, the range-finder and focussing adjusting arrangement must have been accurate and accurately utilised, and the camera must have been held as steady as a rock, while, in the second, the exceedingly fine grain of the film was essential in order that the acute definition of the lens might be resolved, and both are dependent upon the utmost technical accuracy in after-treatment.

The fine rendering of the subject illustrates the power now rendered available by the latest and most modern developments in the design and manufacture of the miniature camera; by the speed and resolving power of the film emulsions of to-day, and by the special developing mixtures calculated to extend their possibilities to the utmost. Not only is the range of possible subjects vastly increased, but difficult subjects are rendered much more easy and the ordinary run is greatly facilitated.

At the same time, it must be remembered that instruments of precision such as these do require a considered accuracy and equal precision in handling if the best is to be obtained from them.

That such has been done in this instance is evident from the decisive quality of the presentation, a quality that is worthy of study and emulation.

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

THE sky in No. 1 of the prints reproduced on the opposite page—"Summer Shower," by L. Cory—is quite an excellent feature, the gradations of the clouds being well recorded and the feeling of luminosity being adequately retained.

Foreground and Distance.

The last-mentioned quality, no doubt, is enhanced by the depth of tone in the distant cliff, and, to some extent, by the deeper tone of the sea, but the addition of the stretch of promenade in the foreground is not so good, for it seems to strike a note of incongruity, and does not enhance the naturalness of the scene.

It would appear that it was only necessary to cross the roadway in order to secure a perfectly natural foreground of shore or sea, and why on earth such an uninspiring stretch of macadam and wall should be preferred to the aforesaid shore, goodness only knows. The foreground, admittedly, should be chosen to suit the distance, but, in this case, it cannot by any stretch of the imagination be said to do so, and it is somewhat surprising to find that the vision that could select so fine a sky could overlook the failings of the foreground.

But there it is. A subject of some little merit in its class has been quite spoilt by the want of a little judgment at the time of exposure, and, if anything is to be done with it, it means retaking—the chance for which may never arise.

In No. 4, "Clouds," by F. A. Beale, the rendering of the sky is no less effective and the formation of the clouds is very good. The landscape portion, however, does not seem to show much sense of order in its arrangement, even if no anomalous feature makes an appearance.

Order and Arrangement.

Something might be done towards improving it by trimming about three-eighths of an inch from the base and three-quarters of an inch from the right. This removes the intrusive patches of foliage in the immediate foreground and tends to throw some importance on the upstanding bush or tree on the left so that it acts as a centre of interest. More space, however, is needed on the same side to give it a real significance, but presumably there is no more on the negative.

A much better feeling for arrangement is disclosed in No. 5, "Thornton Abbey," by A. E. Thompson, where the fine mass of the building is not only well placed in the picture space, but the viewpoint is well chosen with the idea of showing it prominently against the sky. The trees on the left are of a good shape and help to set off the imposing nature of the abbey, while the one on the right, if not so attractive in form, does serve a useful purpose in that it unobtrusively completes that side of the subject.

The sky, however, is an unfortunate feature. It is nothing but an expanse of utter blankness, and certainly cannot be accepted either as a true or conventionalised representation of the infinity of space we know as the sky.

Landscape and Sky.

Could a similar sky to that of either (1) or (4) be substituted, always assuming the same lighting, the subject would be infinitely enhanced, and, if the opportunity arises, a suitable sky might be secured and printed in on another occasion, or, if the subject can be retaken, it might be tried again and more care devoted to the retention of tone in the sky.

In this connection it may be mentioned that a sky filter is a useful aid, especially if employed in conjunction with colour-sensitive or panchromatic material, and the point is one that might well be kept in mind.

Similar remarks apply in connection with the sky of No. 6, "A Piece of Dartmoor," by Mrs. M. G. Hepburn, though, here, the blankness is less assertive, for the sky is only a narrow strip. Nevertheless, both it and the water could do with a perceptible increase in depth, and it is just possible that an improvement might be effected by carrying printing a shade or so farther. It is rather questionable, however, if it were altogether wise to include so wide a stretch of water, for its expanse is inclined to be uninteresting, particularly as, owing to the height of the viewpoint, there are no reflections or anything in the nature of variation of tone to lend it attraction.

Change of Stance.

Quite a slight change in viewpoint might offer a better arrangement, either by restriction of the area allotted to the water or by permitting the introduction of reflections, but, to be certain about it, it would be necessary to dodge about a bit on the actual spot and to note the changes in the disposition of the subject that follow changes in the stance.

Nos. 2 and 3, "The Falls of Virginia Water," by W. A. Farley, and "Sunshine and Shadows," by F. A. Larner, fall into a different category, inasmuch as, for all practical purposes, the sky is entirely excluded. This is a device that is often of service, for it enables the competition of the light of the sky with the lights of the subject to be avoided. With No. 2, for example, the addition of a sky would cause the lights on the falling water to lose quite a considerable proportion of their value, whereas, at present, they tell with some effect, although, had it been found possible to reduce the brilliance of some of the light passages near the edges, the falls would have been brought into greater prominence.

The slight fogging along the top appears to arise from either halation or irradiation, or reflection inside the camera from a light just outside the field of view. The effect of the first two can be very much reduced by the employment of material with an anti-halo backing, and the third can be counteracted by an efficient lens hood, it being assumed, of course, that the interior of the camera itself does not need reblacking.

Woodland Subjects.

The device of excluding the sky is scarcely so effective in "Sunlight and Shadows" as in its predecessor, not, however, because of the omission, but because the lights of the sunlit foliage are placed too near the left-hand margin to attract and hold the attention. Moreover, the technical treatment is much at fault, for not only does there seem to be an appreciable degree of under-exposure, but the negative is considerably over-developed, faults which have to be specially guarded against in woodland subjects.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

TYPICAL STREET VIEWS.

LAST week I gave a few hints on subjects we may find by or near the roadside on our journeyings to and fro, when we are accompanied, as we should be, by a small camera for the purpose. I am now suggesting that we may well make a certain number of records of some of the streets and roads themselves, as they often give a better idea of the places we visit or pass through on our travels than do isolated buildings.

Only yesterday on a London motor-bus I noticed a visitor making through the open front window a series of miniature snapshots of the streets we traversed. It was not an interesting route, but in more favourable circumstances, and with less rain, the idea would have been a good one. On another occasion, in the village of Corfe Castle, I saw one motorist after another pull up for a moment at just about the same spot, take a hurried shot at one of the most-photographed views in the country, and rush on. If it was an open car he stood up and fired; if it was a closed one he popped out and popped in again.

Well, anyhow, the idea is all right, but it can generally be carried out with a little more consideration and care.

A moment's thought will show that there is a wide range of variety in such subjects. There is everything from the bustling city street to the by-road through a secluded hamlet, and there is infinite variety in the character of both.

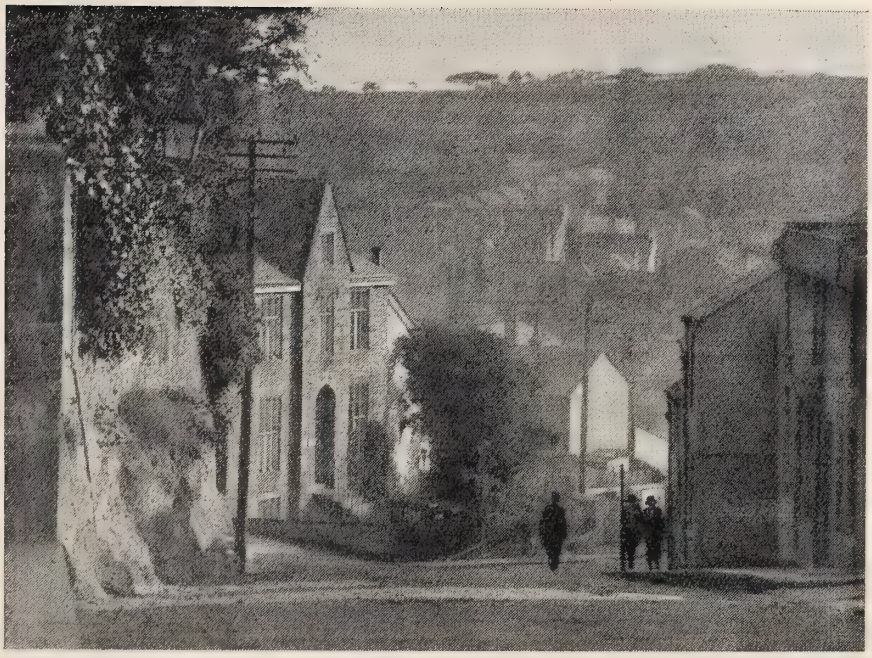
By the way, the original distinction between a street and a road was that the former was paved with stone of some kind or form, while the latter was the natural soil cleared and levelled. The distinction has long vanished, and a country lane may be superficially the same as an arterial road. But it is the buildings that line the way that give it distinctive character.

The three illustrations, taken from stock at random, demonstrate the fact. They are quite different, although each of them has more or less facsimiles scattered about the country.

It is seldom that the middle of the road gives the best view of such a subject, even in those rare cases in which the photographer would have a chance of surviving the adventure. A position from one side is preferable and far safer, and a bit of judicious manœuvring will generally result in finding a viewpoint that provides a typical and characteristic version of the particular road.

In the case of Lavenham, there are

Lavenham, Suffolk.



Rayleigh, Essex.

more picturesque streets, but this is the main road through the town, and is therefore the most familiar to travellers, especially as the view includes the largest hostelry (pub.). At Rayleigh the High Street runs up to the church, where it forks, and this also would be a familiar spot to the wayfarer. The Truro road is one of several that dip down into the valley in which most of the town lies. This was a personal record, and a more effective selection would have been one showing something of the cathedral.

I say that the one shown is of personal interest, because it is as I often saw it in the evening light on my return from a day's excursion. It is the only one of the three with any suggestion of interesting lighting. One of the handicaps of such subjects is that we so often have to take them just as they happen to be at the time of our passing. The odds are of course against its being at its best.

Very often the best lighting arrangement is when one side of the road is in sunlight and the other in shade, as then the houses on one side will throw their shadow shapes across the road, and give interest to what would otherwise be monotonous.

Truro, Cornwall.

In narrow streets, always more or less in shadow, care will have to be taken over the exposure. I have found that in such cases 1/10th of a second at f/8 or even f/4.5 is none too much.

W. L. F. W.

Sports Subjects for Beginners

THE beginner is often in doubt whether the apparatus he has is capable of tackling what are known as "sports" subjects, which generally involve rapid movement. He often has an idea that very expensive special apparatus is necessary, particularly a lens working at an extraordinarily large aperture, with a shutter capable of giving the popular thousandth of a second.

As a matter of fact a good many interesting sports subjects are taken quite successfully with cameras of very moderate cost, and with no faster exposures than a fiftieth or even a twenty-fifth of a second. But success depends on (a) taking the subjects at a considerable distance, and enlarging the small image so obtained; (b) only taking objects moving towards the camera, and not across the field of view; (c) taking those features which do not involve ultra-rapid movement; and (d) selecting moments of "arrested motion."

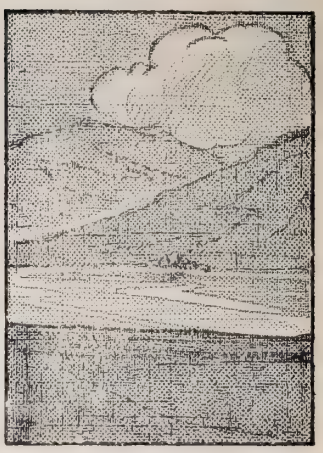
A familiar example of the last-mentioned is a swing. It is moving fastest at its lowest; and a side view, close up, might well demand a thousandth of a second. But at its highest there is a moment when it is going neither up nor down, and a twenty-fifth may be adequate.

Some years ago, Dr. Adolphe Abrahams, a recognised authority on this class of work, produced the finest of results under conditions much less favourable than those of many beginners to-day. His lens, on a half-plate reflex, had f/6.3 as its full aperture; for a quarter-plate camera he recommended f/4.5, the focal length being shorter.

On the subject of plate speeds he said: "Although modern plate manufacturers vie with one another in producing plates of increasingly high H. & D. value, up to 700 or more, that is not the plate for ordinary high-speed photography. Better work will be done with the medium type (250–300 H. & D.) which is quite sensitive enough for any work, even at f/6.3, and is particularly suitable for prolonged development and the coaxing of details without fogging. It is nowadays possible to obtain films which are sufficiently fast, but on the whole it is my experience that better work will be ensured with plates."

Dr. Abrahams made these remarks no longer ago than 1928; and he could not foresee that to-day even the beginner would be using films faster and better than anything then obtainable. This is equivalent to using a more rapid lens, and makes successful work possible under lighting conditions that would have given even Dr. Abrahams pause.

The beginner should be encouraged by the fact that sports work is at least as well within his reach as it was with even the experts of the past—and a pretty recent past, too. If he has an inclination towards this interesting branch of work he should forthwith try his hand at it. He should begin with comparatively simple subjects, and find out how far he can go.

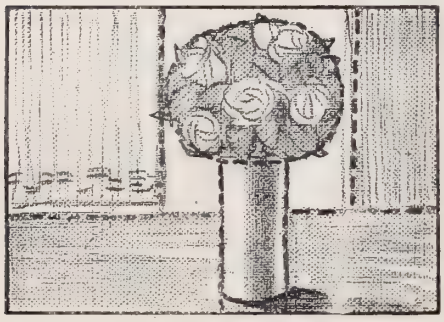


Quite a familiar, popular and reasonably cheap camera to-day is the $3\frac{1}{2} \times 2\frac{1}{2}$ reflex, with focal-plane shutter and f/4.5 lens. This, with fast plates, is as near the ideal for sports work as may be. With a little experience its user can do practically anything and everything in the sports line, and many other types of cameras are not far behind it.

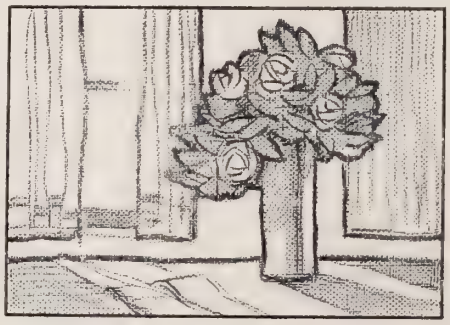
At first the beginner's chief difficulty will lie in judging exposures. Some guidance may be obtained from tables, but their use is limited. He must learn by experience, and should keep records for future guidance. For each class of subject—high jump, sprint finish, hurdles or what not—he should record distance from subject, angle of view, stop, time of day, light and exposure.

L. F.

Picture Points



No. 12 (New Series) *by RICARDO*



Regular Shapes of Objects and Backgrounds.

JUST as we have seen that tones which are too even and regular in depth can be uninteresting, and even boring, so can we have contours or outlines that are too regular in *shape*.

In the first illustration of the still-life subject the objects have been purposely drawn in regular shapes and emphasised by the dotted lines. The flowers have been *too* carefully arranged and tidied up, with the result that the outline conforms too much to a circle and there is not sufficient variety in it. Again, the window on the left, although its *tone* is broken up by the curtain, leaves us with an outline that is much too regular to be interesting. This applies more or less to the rest of the shapes. If there were only one of these shapes and the rest were of more pleasing contours, it would not be so bad.

The lower sketch shows how these faults can be removed, with a general improvement in the whole picture arrangement. As can be seen, it is not only the shapes of the articles themselves that must be considered, but the shapes of the intervening spaces and backgrounds are also equally important.

Aerial Perspective.

IN last week's "Picture Points" we discussed one form of including the three planes of foreground, middle distance and the far distance as an aid for suggesting the effect of perspective. In that point the illusion of the third dimension was provided by the gradually receding sizes of the objects included, and if these could be "scaled" or given some proportion then a greater effect would be obtained.

There is, however, one drawback to this method, and that is that aerial perspective is more or less completely disregarded. By aerial perspective is meant the suggestion of distance by the presence of haze which, to the eye, indicates the distance by the density of the atmosphere and, of course, the gradual obliteration of details and shapes.

The top sketch gives a rough idea of how the three planes can offer no suggestion of distance because there is a lack of proportion on each, such as a house, etc., and that all three tones are much about the same. For record work such clarity in the atmosphere is ideal, but for pictorial work it is a little too realistic to hold our imagination for long. This is one of the disadvantages of using colour filters for the purpose of emphasising the clouds—it emphasises everything else too.

Compare this with the lower sketch and notice how the gradual weakening of tones suggests distance. A figure has been included to break up the regular foreground shape, and also to give some point of interest.

Leading the Eye into the Picture.

PICTORIAL composition is nothing more than an intelligent use of several devices by which the general arrangement of line, form and tone can be made to appear pleasing to the eye. As to how good or how bad any composition may be depends on the eye that sees it, but that is another story.

To the person who has no experience whatever in graphic art, such a picture as that suggested by the left-hand sketch might appear quite pleasing and interesting, particularly if it were full of detail or possessed some personal interest. But as far as pictorialism is concerned, quite another matter, it is very poor.

Its weakest point lies in the way that the roadway comes to an abrupt end at the point marked with a cross. Because of the lines of the road, its receding position from the foreground, and its contrasting tone, it literally forces the eye to follow it, and long before the eye has had time to enjoy the journey and arrive at a pleasing point of interest, it comes to a sudden stop. There is nothing to do but to hop over to another interesting spot in the hope of seeing something more satisfying, and it is this that is so distracting to the æsthetic mind. If we took a higher viewpoint, our only alternative, we should be able to see more of the road and so follow it to the main point of interest easily and pleasantly. This has been suggested by the right-hand sketch.

This "follow through" is not restricted to landscapes, but can appear with all other types of subjects and, of course, takes many various forms.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Filming on the Beach

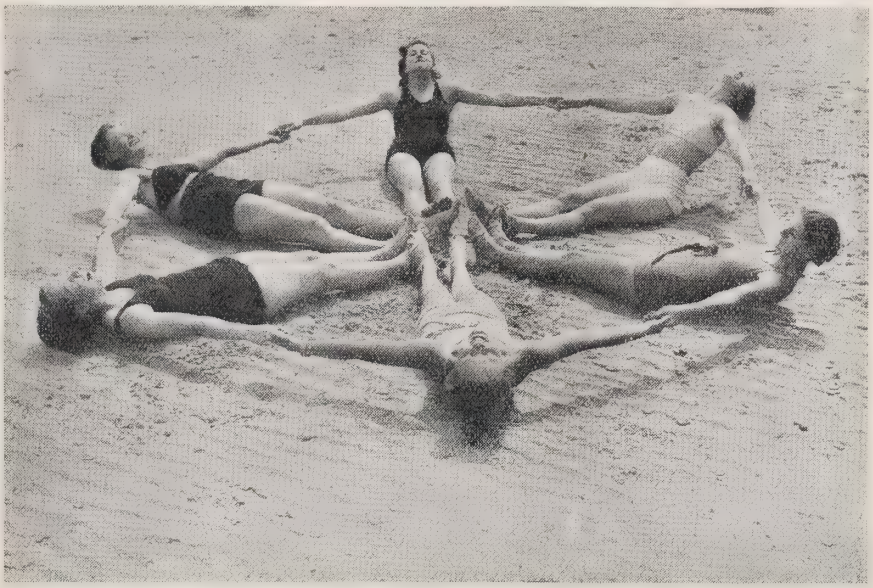
By JAMES A. SHERLOCK.

The following practical suggestions on this topical subject are from our American contemporary, "Movie Makers." The advice given applies equally to amateur cinematographers in this country.

IT is easy to make a casual beach movie, for there is interesting action on every hand, and attractive backgrounds of ocean, dunes and sky, while the modern beaches offer the colour filmer a riot of brilliant hues.

However, if you are planning a serious picture of the beach—a real cinematic effort at first-class beauty and entertainment—you will find that few subjects require more careful planning before the actual filming begins. This is especially true if actors are involved, for otherwise movie-making must compete with the enticing diversions of the beach itself.

When the plan has been completed, it is also wise to make advance test shots under various lighting conditions and with the assortment of filters that will be used. This will save film in the long run and will introduce an inevitable difficulty—sand!



If it gets in the case, sand can cause quite a lot of damage to the mechanism of a camera. To prevent the possibility of this damage, place a bag or heavy piece of cloth over the camera on the tripod when it is not being used. The camera case, carrying all accessories, could be placed inside a larger bag, which will help to prevent flying sand from getting on filters, lenses, etc. A new piece of fine chamois should be included in the kit, as spray will quickly collect on the lenses if the breeze happens to be blowing from the sea. Chamois will give better results at the seaside than lens cleaning paper. Many movie-makers have two cameras, one of which is an inexpensive, second-hand model kept for work such as this, which might be hard on an expensive type.

Test shots will prove that the hours between 10 a.m. and 2 p.m. do not give as satisfactory results for black-and-white filming as the early morning or late afternoon. Between these hours the sand is a glittering, shimmering surface; shadows are contracted and the glare compels people to screw up their eyes. Detail is missing in the sand formations because of flat lighting. The oblique lighting of early morning or late afternoon is also noticeably valuable in picturing foamy breakers. It causes them to appear thick and creamy, while around midday they lose their depth and frothiness.

A photo-electric exposure meter is a very important aid in beach filming, but one must use it properly. A meter of this type collects light rays to within an angle of thirty degrees on each side of the lens axis. This angle can be mentally pictured by looking at the hands of a time-piece that is set at five minutes past 11 o'clock. Because of this angle, it is expedient to take your meter to within a few inches of the subject or of some similar object under the same lighting conditions.

For example, let us say that it is desired to make a close-up of a man's head against a clear sky, which would call for a two-inch lens with the camera about five feet away from the subject. Now, if the light meter is held at the

Two typical beach subjects for the ciné camera.

camera position, the reading will be affected by the sand and sky. But if the meter is held within three inches of the man's head, only the reflected light will be measured. Since the facial detail is wanted, the lens would be set at the latter reading.

A selection of filters is important if panchromatic film is being used. I find that I get the best results if the film and filter are made by the same manufacturer, although this is a fine point. The reason that filters are particularly recommended with panchromatic film at the beach is that this film is very sensitive to blue light, while this colour predominates at the seashore. A filter must be found that will reduce the amount of this light reaching the film.

I have found a deep yellow filter best. This will not give perfect colour renditions, as the sun-tanned flesh does not register sufficiently, but some colour must be sacrificed if deep filters are used.

Instead of buying a separate filter for each lens, a combination sunshade and filter-holder can be used. This will hold the standard two-inch square filter, and, at the same time, it prevents sunglare when filming with lighting that might cause it otherwise.

Another difficulty arises when filming horizontally close to the hot sand. Scintillating heat waves are rising. If a telephoto lens is used, these waves are more prominent on film than to the eye. Sharpness is impossible in taking a scene with a telephoto through these waves.

If shooting is compulsory when the sand is hot, it will be found better to come close to your subject and to use a high angle. From this angle, the heat waves will be more scattered. Just after a shower is the ideal shooting time, as the sands are cooled.

A two or three inch lens is convenient because, with it, close-ups of persons can be made without the subject being aware of the camera. If children are to be photographed, first accustom them to the idea by showing them an empty camera on a tripod. Let them look through the view-finder and start the camera a few times. They will soon become tired of it and shift their attention back to their own games. Then you are ready to make the sequence.

If you are presenting a scene from the viewpoint of a child, place the camera low, so that you can film from his eye-level. If the scene represents an adult looking down at the child, place the camera at the adult's eye-level. Again, if the child is to look at the man, place the camera low, tilted upward to take a close-up of the man's face against the sky as the child would see it.

Surf-board riding is best filmed from a position at right angles to the breakers, and a four-inch lens is recommended. If there happens to be a flat rock about ten feet from the water's edge, it will provide a convenient and safe camera platform. Then, if the boards are about 100 feet from the camera, the surf-board rider will fill the picture when the four-inch lens is used.

Picture composition has to be sacrificed in a holiday crowd. But one can make a few carefully composed scenes for the opening of the picture, and these will establish the locality. Then, as the movement quickens, *tempo* is the important thing.

When editing, be ruthless with your pet shots. More films are spoiled by long scenes than by short ones. It is useless to say that any one scene should have a particular length ; one shot might be three feet long and the next a foot long. Scenes in action films should be shorter than those in scenic pictures. If the scenario has been written with care, few titles are needed and they should be short and to the point.

If you have had your camera on the beach much during the summer, return it to the maker for overhauling.

A Prize Competition for Novices

THIS competition is specially for those readers of "The A.P." who are Novices ; that is to say, amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups, or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

Our readers who are Novices have all the summer in which to make their prints for this competition, and the prizes are worth having.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows :—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.
The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.
The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.
Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 30th. This will give new readers who are Novices, and who intend entering this competition, every opportunity of improving their work during the next two months by reading *The Amateur Photographer* every week and obtaining their competition prints during the summer holidays.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows : The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices" Competition.

Further reference to the competition will be made week by week, and hints given for the best treatment of various subjects for Novices.

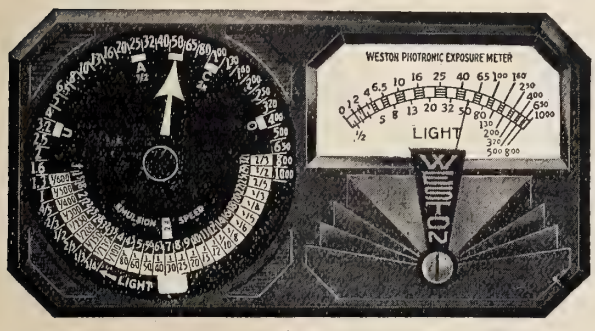
CAN THE CAMERA LIE?—A New Competition

IN the Summer Number of *The Amateur Photographer*, published on July 22nd, a new competition was announced in connection with articles that appeared in that issue dealing with "pictorial inexactitudes." It was demonstrated that by judicious application of the camera, combined with unusual viewpoints, or by double exposures, results were obtained that on their face value appeared to be unreliable.

In this competition, prizes are offered for the best photographic "untruth," but the prints must be quite straight and from untouched negatives. Combination prints, or prints that have been built up by cutting out other photographs and copying, or prints that have been obtained by various "control" methods, are not eligible for this competition.

The prizes are **5 guineas, 3 guineas, 2 guineas, 1 guinea** and **10s. 6d.** They will be awarded for what are considered to be the best efforts in making the camera "untruthful." The negatives of the winning prints and of any others must be submitted for inspection if required. Technical data should also be given regarding the production of the photographs.

There are no other conditions beyond those mentioned above. A special competition coupon, which appears each week in the advertisement pages, must be affixed to the back of each print. The closing date will be September 30th.



Entries should be addressed to the Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and should be marked on the envelope, "Special Competition."

Buy a WESTON METER once

Because of its greatly increased sensitivity, the new Weston Meter can be used indoors or out with equal success. It will instantly give you correct settings for any type of exposure. Universal model for Still or Ciné Cameras is simple for the novice—comprehensive for the expert. Leica model, specially designed for speed and simplicity when using the Leica Camera.

FOR CORRECT EXPOSURES ALWAYS

Get a Rolleiflex AND WIN THE PRIZES

Reproduced by courtesy of the "Daily Herald."

The two pictures reproduced here both won prizes for their owners. The lower picture won the *Daily Herald* £2,500 first prize last year, and the upper picture won a first prize in the European Rolleiflex and Rolleicord Competition.

Numerous other prizes have been awarded in photographic competitions to Rolleiflex owners. This proof of Rolleiflex superiority in capturing charming and unusual subjects should influence you in your choice of a miniature camera.

Rolleiflex takes 12 exposures on 3½ × 2¼ 8-exposure roll film for 1/-. The square format proves an advantage for enlarging or trimming your print to any desired shape. Fitted with one-lever Compur shutter with speeds from 1 second to 1/500th, Time and Bulb. The Zeiss Tessar f/3.5 lens is fast enough for all subjects in any light.

Numerous accessories are available which will convert the Rolleiflex into a plate camera for single exposures, or for taking pictures on 35-mm. ciné film or for stereo work, etc. **£25**

Have you got your copy of "**The Golden Book of the Rolleiflex**"? Over a hundred pictures of Rolleiflex masterpieces — beautifully reproduced, together with technical data, this book will inspire and help every camera owner to better and more enjoyable photography.

Price 7/6

Ask your dealer to show you the Rolleiflex and complete range of accessories, or write to the address below for complete book of accessories.

Look for this sign on your Dealer's window.

Exhibitions and Competitions

CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, August 31. Rules in issue of July 29.

The Amateur Photographer Novices' Competition. Prizes of Roll Film for Novices' Prints. Closing date, September 30. Rules in this issue.

The Amateur Photographer Special Competition, illustrating "Can the Camera Lie?" Entries close September 30.

Wallace Heaton "35-mm. Film Competition." Cash prizes every week. Open to readers of *The Amateur Photographer* only. Full particulars in advertisement page in this issue.

XVme Salon International de Photographie de Bruxelles.—Open, May–October. (M. Maurice Broquet, Secretaire du Salon, Rue du Sceptre, 77, Brussels.)

Salon International de Fotografica de Madrid. (Señor Secretario de la Sociedad Fotografica de Madrid, Calle del Principe, 16, Madrid.)

The Listener. Cash prizes for photographs under general title "Conversation Pieces."—Open, July 8–August 25. Entries, Monday morning of each week. (Editor, *The Listener*, Broadcasting House, London, W.1.)

The Folkestone Camera Club, Competition for the best photographs of Folkestone.—Entries close September 30. Cash prizes. (Ernst. F. Davidson, Hon. Secretary, Folkestone Camera Club, Town Hall, Folkestone.)

Chicago International Salon.—Open, July 23–October 4. (Alex. J. Krupy, Chicago C.C., 137, North Wabash Avenue, Chicago, Ill.)

XXXIe Salon International D'Arte Photographique de Paris.—Open, October 3–18. (M. E. Cousin, Secretaire de la Société Française de Photographique, 51, Rue de Clichy, Paris (9E).)

Radio Photo Club de Spa. IVme Salon International de Photographie.—Open, August 9–30. (M. René Chalséche, Avenue Marie-Thérèse, 13, Spa Belgium.)

I Salon Internacional de Fotografia de San Sebastian.—Open, August 5–20. (Sr. Secretario General Salon Internacional de Fotografia de San Sebastian, Calle San Marcial, 26, San Sebastian, Spain.)

Forty-fifth Toronto Salon of Photography.—Open, August 28–September 12. (W. H. Hammond, Secretary, Toronto Salon of Photography, 2, Gould Street, Toronto, Canada.)

Museum and Public Library, Maidstone. Exhibition of Nature Photography.—August 15–29. (C. E. Fisher, Museum and Public Library, Maidstone.)

Tweede "Focus" Fotosalon.—Entries, August 10; open, September 12–27. (Focus, Ltd., Fotosalon, Bloemendaal, The Netherlands.)

South African International Salon.—Entries, August 14; open, October. (Hon. Secretary, Johannesburg P.S., P.O. Box 7024, Johannesburg, South Africa.)

Royal Photographic Society Annual Exhibition.—Entries, August 14; foreign entries, July 31; open September 12–October 10. (Secretary, R.P.S., 35, Russell Square, London, W.C.)

Buffalo C.C. Fourteenth Annual Salon of Photography.—Entries, August 15; open, September 6–27. (H. W. Schonewolf, 528, Elmwood Avenue, Buffalo, N.Y., U.S.A.)

Morecambe, Heysham and D.P.S.—Entries, August 19; open, September 9–16. (James F. Levisohn, B.Sc., 5, Douglas Drive, Heysham, Lancs.)

Fotoclub Zagreb. Fourth International Salon of Photography.—Entries, August 20; open, October. (Fotoclub Zagreb, Masarykova II, Zagreb, Yugoslavia.)

London Salon of Photography.—Entries, September 2; open, September 12–October 10. (Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

Lincoln Camera Club.—Entries, September 5; open, October 15–November 12. (Miss E. Redfern, 146, Burton Road, Lincoln.)

XII Salon International de Fotografica, Zaragoza, Spain.—Entries before September 10; open, October. (Secretary, Sociedad Fotografica de Zaragoza, Plaza de Sas, 7, Zaragoza, Spain.)

Third Canadian International Salon of Photographic Art.—Entries, September 10; open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, National Gallery of Canada, Ottawa, Canada.)

Windlesham C.C.—Entries, September 10; open, September 25–26. Classes for members (Beginners, Advanced, Professional, also Open Class). (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

IV International Hungarian Exhibition.—Entries, September 15; open, October 24–November 9. (Secretary, Magyar Amatörfényképezök, Orsz. Szövetsége, Budapest VII, Erzsébet-körut, 9, Hungary.)

Rotherham P.S. Forty-seventh Annual International Exhibition.—Entries, September 21; open, October 14–17. (E. George Alderman, Ruardean, Newton Street, Rotherham.)

Service Co. (London), Ltd., Happy Camp Snaps Competition. Cash prizes.—Entries, September 30. (Service Co. (London), Ltd., 273, High Holborn, London, W.C.1.)

Coronet Midget Camera Competition. Cash prizes.—Entries, September 30. (Coronet Camera Co., 310, Summer Lane, Birmingham, 19.)

Eighth International Photographic Salon of Japan.—Entries close in Tokyo, September 30; open, November (Tokyo and Osaka). (Sec., International Photographic Salon, Tokyo Asahi Shimbun, Tokyo, Japan.)

Photographic Society of America 100 Print Salon. Entries, October 1. Limit 4 prints. Entry fee $1.00. (Dever Timmons, Salon Secretary, Box 216, Cashocton, Ohio.)

Johnson's "Holiday" Competition. Cash prizes.—Closing date, October 31. (Johnson & Sons, Ltd., Hendon, N.W.4.)

U.P. International Exhibition of Photography, 1936 (Lucknow).—Entries, November 1; open, December 5, 1936–February 4, 1937. (Dr. K. N. Mathur, D.Sc., A.R.P.S., Hon. Sec., U.P. Amateur Photographic Association, Lucknow University, Lucknow.) Entry forms obtainable also from the Editor of *The Amateur Photographer*.

Tenth International Christmas Salon of Pictorial Photography (Antwerp).—Entries, November 15; open, December 20, 1936–January 3, 1937. (J. Van Dyck, Sec., Fotographische Kring "Iris," Ballaestr. 69, Antwerp.)

Leicester and Leicestershire P.S. International Exhibition of Pictorial Photography.—Open, February 22–March 14, 1937. (H. Foscutt, 19, Doncaster Road, Leicester.)

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. They are printed in either the vertical or horizontal form as shown here, and each is complete in itself.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 × 3, supplied for card index cabinets.

The collection when completed will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index, and are now ready. The size of the box is 5½ × 3½ × 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, S.E.1. Price 2s. 6d.

24. GASLIGHT PAPERS

FOR speed of printing and uniformity of results, there is nothing to equal gaslight paper for contact prints. Unlike P.O.P. or self-toning paper, gaslight paper does not show an image on exposure to light, but needs to be developed first in a suitable developer and afterwards fixed and washed. Gaslight paper can be used with any form of artificial light, and does not require the use of a dark-room.

Gaslight paper can be obtained in three grades: "Soft" for use with dense and/or contrasty negatives; "Normal" for negatives of normal gradation, and "Vigorous" for soft and weak negatives.

Although a dark-room is not needed, it is advisable to screen off a corner of the room so that all work of loading the printing frame and developing can be carried out in a weak diffused light.

Sort out the negatives and grade them according to the paper used. Protected from the light, the sensitive side of the paper is then placed in contact with the image side of the negative and placed in a printing frame. The frame is then taken to the light and about 12 in. away from it a suitable exposure is made. The time of exposure depends on the density of negative, grade of paper used, and the distance away from the light.

For an approximate guide, for a normal negative on a normal paper, an exposure of about ten seconds will suffice for 12 in. away from a 60-watt electric lamp. Double this time for incandescent gas.

After exposure, the print is developed. A suitable developing formula is as follows:

Metol	16 grs.
Sodium sulphite (crys.)	1 oz.
Hydroquinone	60 grs.
Sodium carbonate (crys.)	1½ oz.
10 per cent potassium bromide	1 drm.
Water to	20 oz.

The time of complete development should be about 30 seconds at 65° Fahr.

After development, rinse in water and place quickly into hypo fixing bath:

Hyposulphite of soda	4 oz.
Water	20 oz.
Potassium metabisulphite (optional)	½ oz.

After fixing, wash for thirty minutes in running water.

25. LENS FORMULA FOR COPYING

THE following formula is to be used when the focal length of the lens is known, and the number of reductions (lineal) required from the subject matter to the negative image is also known.

From these two facts, the distance from the subject to lens (S) and the distance from lens to image (L) to give sharp focussing can be calculated.

FORMULA.

Focal length of lens (in inches) = F.

S = (F × No. of Reductions) + F.

L = (F ÷ No. of Reductions) + F.

EXAMPLE.—A subject, measuring 12 in. long, is to be copied with a 5-in. focus lens, so that the image will be 3 in. long (4 reductions).

S = (5 × 4) + 5 = 20 + 5 = 25 in.

L = (5 ÷ 4) + 5 = 1¼ + 5 = 6¼ in.

The dimensions are to be taken to the diaphragm, the centre of the lens.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Platinotype.

Can you give me the name of any firm which supplies platinum papers? Can one make enlargements on it? F. P. (Durham.)

The only company of which we know making the paper you name is the Platinotype Co., 66, High Street, Penge, London, S.E.20. The paper is expensive, and cannot be used for enlarging. It is necessary to print by daylight in contact with the negative, and it is then developed. Beautiful results can be obtained with these papers, and it is the most permanent process known, as the image consists of pure platinum.

Stop Bath.

Please supply the formula for a stop bath suitable for using with gaslight prints. How is it used? O. C. L. (London.)

Add one ounce of commercial acetic acid to a pint of water. Keep this solution in a separate dish between the developer and the fixing bath and pass all prints through it before fixing them. The purpose is to stop immediately all developing action, especially useful if a plain hypo bath is used.

Silver Residues.

What is the procedure of collecting the silver in old hypo? T. W. (London.)

The usual method of separating the silver in old fixing solutions is to pour them into a barrel which should be kept covered and out of doors. Liver of sulphur should then be added which will precipitate the silver in the form of sulphide. When a suitable amount of this has been thrown down, the remainder of the hypo should be drained off, and the precipitate collected and dried and sent to a refiner. Owing to the very small proportion of silver present in an exhausted fixing-bath it will require very many gallons of old hypo to make it worth while.

Dark-room Walls.

Having just fitted up a dark-room, I have been given to understand that black or dark walls are unnecessary and that cream is a much better colour. Surely if the walls were this colour all sensitive materials would be fogged. S. T. P. (Birmingham.)

Provided that the dark-room is perfectly light-tight, there is absolutely no necessity to paint the walls black. Cream is a much better colour and is perfectly safe. It is not the colour of the walls or ceiling that matters so much as the light falling on them. If the walls were white and a red safelight were being used, the walls could only reflect the red light and in effect the walls would be *red*. In the same way white dishes are quite safe. Light-coloured walls, doors and shelves, etc., are not only actinically safe, but because they can be seen more easily while any colour safelight is being used, there is less chance of accidents to one's self, bottles and solutions, etc. Should, however, white light find its way into the dark-room, then, of course, the light walls would not be so safe as the black walls.

Acid Hypo for Prints.

What is the advantage of using acid hypo fixing baths for prints. Are the prints made more permanent? When is an acid hypo bath inadvisable? J. T. (Thornton Heath.)

The addition of a weak acid to the hypo bath has nothing to do with the fixing properties of the hypo, either for permanence or for speed in fixing. It has several advantages, however, over the plain hypo bath in that the acid hypo keeps better if it is intended to keep a stock and/or use it repeatedly, the acid neutralising the alkali carried over in the developed emulsion. Also this stops immediately any developing action still taking place in the emulsion, a fact worth bearing in mind with gaslight papers with short development times. An acid hypo bath is not used for self-toning prints and should not be used in metal tanks, but is quite safe with plastic-moulded tanks.

Lens Aperture Values.

How does one compare the exposure values of different lens stops? B. T. Z. (Brentwood.)

All that is necessary to do is to square the stop numbers and then divide the smaller product into the larger product and the answer will be the number of times faster. For example, how much faster is f/4.5 than f/9? 4.5 squared is $4.5 \times 4.5 = 20$ approximately. 9 squared is $9 \times 9 = 81$. $81 \div 20 = 4$ approximately. Therefore f/4.5 is four times faster than f/9. In other words, if the correct exposure at f/4.5 is one second and the lens is stopped down to f/9, we must give four seconds' exposure.

Fine-grain Developers.

Must fine-grain films be developed with fine-grain developers? F. H. T. (London.)

No. A fine-grain film can be developed with any other developer, but, of course, the advantage of the inherent fine grain in the silver is largely lost. A fine-grain emulsion developed with a fine-grain developer will give a finer image than the normal emulsion developed with a fine-grain developer.

Mount Sizes.

What are the usual dimensions of photographic mount sizes? Is there any standard colour? A. D. C. (Torquay.)

Most exhibition authorities have adopted the sizes originally laid down by the London Salon of Photography. These sizes are 25×20, 20×16 and 15×12. There is no standard colour, but most exhibitions prefer either white or light cream, and in most cases these are the best for prints on white paper and prints on cream paper respectively.

Toning and Staining.

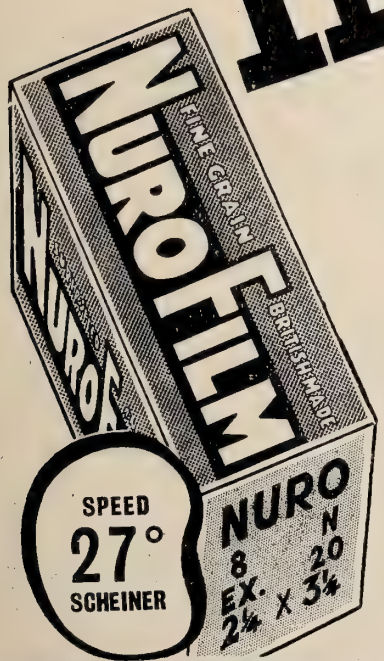
What is the difference between toning and staining a print? D. M. C. (Clapham Common.)

When a print is toned the entire silver image is converted to the required tone, but the paper base is not altered in colour. A stained print, however, has exactly the same coloured silver image as before, but the gelatine and paper base are stained. A toned print, although necessarily more difficult to do, is the more permanent of the two, and retains a one-colour effect, whereas the stained print must always bear a two-coloured effect which does not appear to be quite so natural.

Spotting Glossy Prints.

How can I spot prints after glazing so that I can match up the glossy surfaces? J. E. M. (Greenock.)

If water-colour is used, all spotting can be done after the print is glazed without any difficulty in matching up the glossy surface. Mix a little gum with the tint and a minute or two in experimenting with a spare print will show the right proportion of gum to use. A good plan is to brush gently the gummed edge of an envelope with the brush already moistened with the right tint.



It's NEW

It's EXTRA FAST

It's ALL-BRITISH

HERE is a new film which cannot fail to be enthusiastically received by all keen photographers. Made from first to last in our British factory, NURO Film has the new feature "Lastic Latitude"—the greatest degree of latitude in any film. NURO is a fine-grain, fully orthochromatic film, with a speed of 27° Scheiner, ensuring clear, crisp pictures always.

Obtainable through all branches of Boots The Chemists; stocked by all branches of Timothy White's & Taylors and Taylors, Dispensing Chemists, and from all Good Dealers.

THE London Salon of Photography 1936.

SENDING-IN DAY, Wednesday, September 2nd.

THE TWENTY-SEVENTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at The Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 12th September, to 10th October, 1936.

CONDITIONS OF ENTRY (Please read carefully).

1. Pictures must not be framed; but may be mounted or unmounted. Each picture must bear on the back clearly written (a) name of artist; (b) number and title of picture, corresponding to particulars on the Entry Form.
2. When mounts are used they should conform to the following sizes—25 × 20, 20 × 16, or 15 × 12; but no mount to exceed 25 × 20; and it is suggested that white or light-toned mounts be employed. Prints may be of any shape or size, provided they do not exceed the limits of the mounts as given above.
3. All packages of exhibits from abroad must be clearly marked on the outside: "PHOTOGRAPHS FOR EXHIBITION ONLY—NO COMMERCIAL VALUE—TO BE RETURNED TO SENDER." *No prices to be marked on the prints.*
4. Pictures sent unmounted will be suitably mounted by the Salon Committee and all accepted pictures will be shown under glass.
5. Pictures must be sent by post or parcels post, packed flat and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.
6. All pictures for the exhibition must arrive at the above address *on or before* Wednesday, September 2nd. Entries may be delivered by hand at the Gallery on that date only.
7. The Entry Form for pictures from abroad must be sent SEPARATELY by post, together with entry and packing fee of 5s. (this fee covers any number of pictures from one exhibitor). Exhibitors residing in the British Isles may enclose Entry Form and fees with their pictures.
8. Pictures sent by post will be repacked in the original wrappings and returned, carriage paid, after the close of the exhibition.
9. As applications are made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify, in the space provided for the purpose below, whether they have objection to such permission being given. The copyright in all cases remains the property of the authors of the prints.
10. The Committee assure intending exhibitors that the greatest care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.

If pictures are sold a Commission of 15% is payable to the Salon.

The submission of pictures will be understood to imply acceptance of the above conditions.

Notification of acceptance of pictures will be sent out as soon as possible.

A Catalogue will be sent to each exhibitor.

¶ Readers of ***The Amateur Photographer & Cinematographer*** who are preparing work for this year's Salon may use this page as an ENTRY FORM.

SEE CONDITIONS.

¶ Intending Exhibitors who are unable to secure extra Entry Forms in time may prepare their own on plain paper provided the conditions of Entry are adhered to.

ENTRY FORM.

TO THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.

Sir,—I submit the undermentioned Photographs for the consideration of the Selection Committee, and I enclose Postal Order (or International Money Order) of the value of 5/- to cover Entrance Fee and the cost of return postage.

Reg. No. (leave blank).	A, B or C (leave blank).	Number on Picture.	Title of Picture.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS :—

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue : 13 consecutive insertions, 5% ; 26 consecutive, 10% ; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry ; Guildhall Buildings, Navigation Street, Birmingham, 2 ; 260, Deansgate, Manchester, 3 ; 26B, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

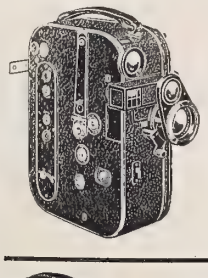
Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

EVEN the Manufacturer refers to us at times as the leading ciné dealers.

We do not wish to boast of this, it is merely because we were Professional Ciné pioneers before the day of the real "Movies" and our staff have been cradled in Cinematography ever since. May we help you ?

THE NEW MAGAZINE CINÉ-KODAK

- No film threading.
- 3 speeds.
- Instant loading.
- Ideal for rapid interchange of monochrome and Kodachrome.
- Audible footage timer.
- Each charger has its own footage indicator.
- Interchangeable lens and optical and instantly variable view-finder.
- Very compact and beautifully made.

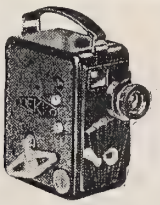


Price, with f/1.9 lens, including leather case **£40 0 0**

Or 12 payments of £3 10 0.

You must always have a supply of fresh Ciné Film, since film kept in stock loses speed. Our stock is changing daily, due to big turnover. Send for your ciné film C.O.D., or open a credit account

ZEISS 16-mm. MOVIKON



THE PROFESSIONAL-AMATEUR CINE CAMERA

50 or 100 ft. reels. Fitted with coupled range-finder. Finder has automatic parallax for various lenses.
Predetermined footage indicator.

SHEFFIELD — One minute walk from Town Hall
Grams : Photo, Sheffield. Phone 22079 (2 lines).

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer." The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged ; over £10 and under £50, 2/6 ; over £50 and under £75, 5/- ; over £75 and under £100, 7/6 ; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed **& Co.**

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.
For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

DUNSCOMBE'S

"PERSONAL" CAMERA COLUMN

'SERVICE SUPREME'

ELMAR ACOOS

CHAPTER III.

Being extracts from his diary written in the Mayor's Parlour at Chortle-cum-Hardy.

●

"I have had a very hectic day with Mayor Itchin and the Surveyor on a little matter about drains. Mrs. Smith-y-Smyth, of the Old Manor House, complained of a nasty smell, which we duly had to investigate, and in due course were able to secure some realistic 'Bring 'em back alive' epic pictures of the cause of the bother, namely, 10,000 rats, more dead than alive, underneath the floor-boards in the green room of the west wing. The pictures, taken on the celebrated Kodak Super X film (only 1s. 6d. for 36 exposures for Leica Camera loaded, post free in your own spool-chamber). were remarkable considering the conditions under which we had to work, as only by holding the camera rock steady during the 1/8th sec. exposure at f/3.5 was it possible to get any result at all.

"We had no sooner returned from this expedition, when we were called upon to attend the Vicar's sale of work, a truly rural jollification, which called for intimate snapshots of the Vicar's wife endeavouring to sell last season's raspberry jam to the local grocer (retired). These snapshots were finally enlarged and beautifully coloured by Messrs. Dunscombe's so that the grocer's face was an exact replica of the raspberry jam, in fact, as the Vicar afterwards remarked, it was indeed a very fruity picture.

"The next evening being the Mayor's night off, I accompanied him to the local palace of varieties, and from the first box on the right-hand side we got some excellent shots of the 'bally' dancing, as well as attractive angles of the chorus girls. Prints from these negatives are carried in water-cooled envelopes by the Mayor and shown secretly at the conclusion of council meetings, and are much enjoyed, especially by the Medical Officer for Health and the Sanitary Inspector.

"Whilst the latter mentioned pictures were quite attractive from the standpoint of the subject matter, there was a general tendency for under-exposure, and on my recommendation, Mayor Itchin very kindly arranged for me to have a Summar f/2 lens to augment my equipment, and accordingly an urgent message was sent to Messrs. Dunscombe's, who were able, of course, to supply one immediately from stock, and I am now getting thoroughly acquainted with this desirable lens.

"On Tuesday week my friend the Mayor is attending a Stag Party given by the Town Clerk, and, if rumour is correct, I shall have plenty to occupy my time and attention, and I am hoping that the adventures on this occasion will be worthy of inclusion in my book of memoirs, as, naturally, I can only pass on the high-lights of my daily adventures."

Improving the Shining Hour

Whatever the time of day, early morning, afternoon or late evening—as long as there's daylight left—the extra speed of Selochrome Roll Film makes photography not only possible but successful.

Selochrome Roll Film multi-coated and anti-halo backed, is very generous in latitude, and, to add to the perfection of your pictures, renders greens and yellows at their true tone values.

AN UNUSUAL CAMERA

You can see that at a glance

The "Regent" has been *designed*, not simply assembled. Look at its smooth 'streamlining'—no projecting parts at all, everything built right in. It's the handsomest camera made.

But, of course, it doesn't stop at looks. Consider the equipment: Coupled Rangefinder (no more out-of-focus pictures); Two Picture-Sizes Device (eight $3\frac{1}{4}''$ by $2\frac{1}{4}''$ or sixteen $2\frac{1}{4}''$ by $1\frac{5}{8}''$ on Kodak Film No. 620); Zeiss Tessar *f*4.5 Lens; Compur-Rapid Shutter (9 speeds up to 1/400th second; Delayed Action); Optical Direct Vision Viewfinder. Everything you need for good pictures—outstandingly good pictures—is here in the "Regent."

If you're thinking of getting a 'better camera,' this is a camera you must not miss. Ask your Kodak Dealer for interesting descriptive leaflet or write to

Kodak Limited, Kodak House, Kingsway, London, W.C.2.

INCLUDING LEATHER CARRYING CASE

£20 : 0 : 0

"The time has come," the young man said, "to pack a lot of things.
I'll pack my trunk and—let me see—I'll pack my camera, Leica III,
And snap just everything I see, from cabbages to kings."

The Leica will "shoot" everything successfully—distant animals or birds, close-ups or portraits, landscapes, architecture, the theatre stage with ordinary lighting. Quick successive snapshots—3 in 10 seconds. Economical to run, 36 pictures for 2/-. No double or blank exposures. Focal-plane shutter speeded from 1 sec. to 1/1,000th. Small and light—handsome chromium finish. Numerous other features are explained in Leica literature, sent post free on request.

THE Leica CAMERA

Over 500 Leica Accessories actually in Stock.

The most generous exchange allowance in the trade.

Ask for particulars of special Wallace Heaton facilities to registered Leica owners.

Phone: Mayfair 7511 (8 lines). Also at 47, Berkeley St., W.1, and 43, Kensington High St., W.8

The above is an example of the kind of pictures which win prizes—it won a prize in an earlier Wallace Heaton competition.

WHY NOT HAVE A SHOT YOURSELF?

YOUR CHANCE TO WIN £25

IN OUR 35-mm. STILL CAMERA COMPETITION

There's no entry fee—any user of Leica, Contax, Retina, Rolleiflex or Rolleicord (if used with 35-mm. ciné film) is allowed to compete.

This Competition is open from now until September 30th. Your photographs can be of any subject—but they must be taken on 35-mm. film. Prints should not be smaller than 6×4 inches.

Any number of prints can be sent in in any one week, but each photograph must have the coupon attached. In addition to the big prize, a weekly prize of £1 1s. will be awarded for the best photograph submitted in that week.

Each photograph must have on the back a coupon as below, and the name and address of the sender, the make of camera and material used, exposure, etc.

For photographs which appeal to us, not necessarily prize-winners, we reserve the right to purchase the copyright by payment of £2 2s.; in the case of weekly prize-winners by the payment of an extra 21/-. The copyright of the £25 prize-winning print must be made over to us without further payment. *In addition we are offering a special prize of £1 1s. per month for the best photograph submitted depicting a person or persons using a camera purchased from Wallace Heaton Ltd. All prints will be judged at the end of the Competition for the final prize of £25 cash. Acceptance of these rules and conditions is a specific condition of entry.*

COUPON which must be attached to your entry.
WALLACE HEATON
35-mm. Film Competition.

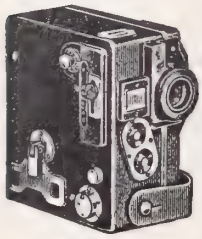
IT'S WHAT CUSTOMERS SAY THAT

Coventry.

"I have now tested the camera and am entirely satisfied. I wish to thank you for the courtesy you have again shown me and to ask you to add this testimonial to the many you have had from satisfied clients." S. M.

Bournemouth.

"I have received the Camera and Plates quite safely. Please accept my heartiest thanks for your kind and prompt attention. The Camera is an absolute bargain at the price. Should I require anything further I will let you know." C. C.



Dublin.

"I wish to thank you for your kindness in letting me have the camera on the H.P. system.

"I may say that I am delighted with it and all my friends say that I certainly got a bargain." E. J. M.

Yorks.

"I have much pleasure in accepting the camera which you sent on approval. I find it suits my purpose exactly. Thank you very much for your prompt and courteous attention to my order." T. R.

The New SIMPLICITY and Certainty

with which correct exposure can be ascertained with the New "Avo" Exposure Meter has won enthusiastic praise from professional and amateur photographers alike. It is the simplest and most dependable meter ever made. The quickest to use. A boon to all photographers, saving time, materials and opportunities.

MR. OLIVER G. PIKE, F.Z.S., F.R.P.S., M.B.O.U., *writes, "My film, 'Nursery Island,' owes the excellence of its exposures to your 'Avo' Meter .... My 'Avo' told me the right stop every time, and I cannot speak too highly of it."*

- Unique method of exposure indication.
- Extreme sensitivity. Gives exposures from 60 secs. to 1/2,000th of a sec.
- Fits vest pocket. Size only 2¼ × 2¼ × 1 in.
- Influenced solely by light received from normal picture angle.
- Can be held and operated in one hand without removal from leather case.

BRITISH MADE

63/-

Real morocco ever-ready case (as illustrated) 5/- extra.

The WORD LEICA

● To all who follow the modern trend in Cameras that word "LEICA" means much. And at each and all of the "Four Westminsters" it has a significance all its own. There, LEICA Cameras and the wide range of LEICA accessories—hardly less notable than LEICAS in themselves—play a very big part in day-to-day and hour-to-hour activities. At any of the "Four Westminsters" you can see and examine the whole LEICA range.

● Go then into any Westminster shop and learn all about LEICAS . . . and EXCHANGING your present Camera, or BUYING OUT-OF-INCOME, which is easily arranged—at the "Four Westminsters."

This is the LEICA Model IIIa, automatic focussing f/2 Summar lens, Shutter speeds to 1,000th. Costs £43, or 9 payments of £5 0s. 4d. (Other models from £16.)

● *Ask about Special Leica "Valoy" and "Focomat" Enlargers.*

That's fine!

SNAPS ON NURO FILM are always finer.... it is the FASTEST FILM YET

Obtainable through all branches of Boots The Chemists, Timothy Whites & Taylors, Taylors Dispensing Chemists, and from all progressive dealers. *STANDARD SIZES AND PRICES*

NURO FILM will help you, more than any other film can, to capture those delicate tones and crisp detail which will make your pictures outstanding. Take better snaps this year on NURO FILM.

NURO FILM is the only film made on British Celluloid—

NURO (Biggleswade), Ltd., Biggleswade, Beds.

NURO FILM

Have you proved their warmth and speed?

The combination of warm tone by direct development with a speed approximating that of bromide paper is unique. Proving these qualities for oneself discovers also the brilliance of the print or slide, the long scale of gradation, the excellent latitude, the range of attractive paper surfaces—and the acceptable price of the plates.

Granville PRODUCTS PRODUCE BETTER PICTURES

Whether used by the novice, the advanced worker or the professional, GRANVILLE PRODUCTS ensure the maximum results with the minimum effort. Every day we receive testimonials from new customers who are surprised and delighted—surprised at the quality obtained at such a low price—delighted with the ease in which such perfect pictures are obtained. If you are just beginning, start right with " GRANVILLE " ; if you have years of experience, change to " GRANVILLE." You will never change again !

"THE GRANVILLE GUIDE"

This new publication is a superb 16-page de luxe illustrated edition. Specially issued for users of Granville Photographic Products, it contains up-to-date working instructions, formulæ, and many useful articles specially written by our own experts. A complete list of all materials is also given, including many new lines. If you have never communicated with us before, **write to-day for your copy.** Applications should be addressed to : PUBLISHING DEPARTMENT, Granville Gulliman & Co., Ltd., P.O. Box 3, Leamington Spa.

If you have previously communicated with us, please do not apply, as a copy will be sent to you.

MAKE YOUR MOVIES IN NATURAL COLOURS...

How much better every shot you take would look in colour. Hitherto you have not been able, either easily or inexpensively, to capture the delight of natural colours for your home cine screen. Now, with DUFAYCOLOR CINE FILM you can take coloured pictures with your 16 mm. cine camera, the only additional apparatus required being a filter supplied free with each spool of film.

And you can show DUFAYCOLOR on your own projector without any alteration or addition; spliced in with your black-and-white films if required. Increased illuminating power is not necessary.

DUFAYCOLOR 16 mm. Cine Film is sold in 50 ft. and 100 ft. daylight-loading spools—and the price includes processing.

DUFAYCOLOR

16 mm. Safety CINE FILM

Get a copy of "The Dufaycolor Process" from your dealer, price 6d., or from Ilford Limited, post free 8d.

VOL. LXXXII. No. 2493.

TOPICS of the Week

READERS are reminded that the last day for sending in pictures for the London Salon of Photography is Wednesday, September 2nd—a fortnight from to-day. Prints may be sent earlier by post, but will be received by hand at the Gallery at 5a, Pall Mall East, London, S.W.1, on that day. Intending exhibitors should note the advice given with the entry form. This applies to most other exhibitions also, and is worth repeating.

If you mount your prints cut the mounts the correct size. Do not use heavy cardboard, thick mounting paper is best. Write the title, and under it your name and address in block letters in the left bottom corner of the back of every print or mount. If you must employ an overlay cut-out mount stick it down at the base as well as at the top—otherwise it may get torn or damaged. If your print needs protection when removed from the packing, don't use tissue paper. Use a stout paper and stick it on the back of the mount at the top and fold over to cover the front. See that it is not oversize or it will show when folded back. Do not use large mounts for small prints. As a general rule print size should not be *less* than 8×6 on 12×10 in. mount; 10×8 on 15×12 in. mount; 15×12 on 20×16 in. mount; and 20×16 on a 25×20 in. mount. Do not put a 15×12 in. print landscape way on a 25×20 upright mount: instead use a 20×16 in. mount the same way as the print. Read the conditions carefully and compare your entry with the particulars you have written on the entry form before dispatching. Pack your prints adequately, but with no superfluous packing. Send them only by post, parcels post, or deliver by hand.

SUMMER CLOUDS AND ST. PAUL'S.

Municipal Facilities for Photographic Societies.

It is interesting to see that the Photographic Alliance is being asked to move in the matter of municipal facilities to photographic societies. It has been asked to try and secure for societies the use of art galleries for exhibitions, and of rooms in town halls or public libraries for meetings. Many societies are fortunate in this respect, either because some of their leading members are associated with the local authorities, or because, without any such prompting, the town councils and their officials realise the value of an enthusiastic local body of amateur photographers. Happening to be in Birmingham the other day, we noticed that the city council there appears to be out to encourage photography by the loan of lantern slides and by a permanent exhibition (the pictures in which are periodically changed) in the central public library. There should be little difficulty with most local authorities if properly approached. In the case of towns which are out to attract visitors or new residents or to develop industries, the value of the amateur photograph as an advertising medium ought to be—though sometimes it is not—appreciated.

Picture Frames.

A new form of catalogue has been published in Berlin, not a catalogue of pictures but of their empty frames. It reproduces nearly a hundred of the picture frames in the Berlin Art Gallery, reproduces them with great photographic care, too, which is very necessary, seeing how elaborate and difficult is the detail of many of them. The earliest

are the frames of Venice and Florence at the close of the fourteenth century. It was at about that period that the picture frame came into being. Until then paintings formed part of the fabric of the building, but then it seems to have been discovered that a frame not only safeguards the picture which it contains, but detaches it from its environment and gives it additional interest. The frames latest in date to be included in the Berlin reproductions are of the French of Louis XVI. The most ornate frames are those of France of a rather earlier period, and of Holland, though some very elaborate frames surround some of the Florentine masterpieces of the middle of the sixteenth century. The value of frames for exhibition photographs has been disputed. The simplicity and restraint of photography calls, if for a frame at all, for a severe one, and a multiplication of ornament would be an offence, but we think that here also the frame has a value in singling out and enhancing the picture.

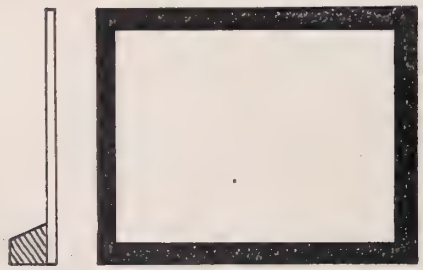
Exhibitions.

The time draws near for the autumn exhibitions, opening before September is half through, and setting the key for the photographic year. One wonders why September was selected as the exhibition month so far as photography is concerned, though it is in May that the painters come out in flower. Possibly it has something to do with the fact that photography is or was considered to be a summer pursuit, and that September was the earliest opportunity of gathering in the summer harvest, while the date of the painters' exhibitions was determined more by the London season. The first exhibition of photography held in London, by the way, in a building which is still standing despite the changes in the Adelphi, took place at Christmas-time—from December 22nd, 1852, to January 8th, 1853. Exhibitions of art of any sort formerly evoked a certain amount of derision. One remembers Dr. Johnson's devastating comment in a letter to his Italian friend Baretti at a time when the exhibitions which preceded the foundation of the Royal Academy were exciting interest. After saying that the exhibition filled the heads of artists, he went on: "Surely life if it is not long is tedious since we are forced to call in the assistance of so many trifles to rid us of our time." And Byron pictures it as one of the delights of the Turkish harem that "No exhibition glares with annual pictures."

For Club Secretaries.

On another page in this issue we give some information which should be of assistance to club secretaries in drawing up their programme for the forthcoming session. We would remind all secretaries that a copy of the completed syllabus forwarded to us will ensure the fixtures being included in "The Week's Meetings." Any alterations in the club, such as change of secretary, may also be sent for revision of the list of societies in *Photograms of the Year*, which will soon be in hand.

READERS' PROBLEMS



Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

A Simple Ciné Screen.

I have only limited accommodation, and project my ciné films on a much smaller scale than usual. Can you advise me how to make a simple but satisfactory screen for the purpose?
T. T. H. (Yeovil.)

We do not think we can do better than repeat briefly the instructions we gave some time ago for an article of this kind. It could hardly be simpler, and its construction is quite easy, while the cost is very low.

Decide first of all by experiment with a sheet of white paper the exact size of the picture you want to project, as this will decide the dimensions of the screen you make. Get a piece of good smooth plywood cut to the size of the picture plus a margin all round of about two inches.

Smooth one surface carefully with very fine glass-paper, and give a thin coat of flat white priming. This may be equal parts of zinc oxide and white lead thinned down with turpentine. Or you can use a commercial article such as "Coverine." When dry, smooth down with glass-paper, dust off, and apply a second thin coat. This should be sufficient, but a third coat can be given if required.

Procure a length of heavy wood, such as oak, and cut to the length of the screen. This is shown in end view in the diagram, and it must be sufficiently large to form a firm support for the screen. Stain this and the edges of the screen dead black. Screw or nail the screen to the support.

Cut four strips of black velvet for the border, and rule light pencil lines on the screen to show the width. Apply adhesive, such as "Seccotine," to the screen outside the pencil marks, and apply the velvet. Do not put any adhesive on the velvet, and only a very thin, even coat on the wood.

Spots on Toned Print.

I send part of a sulphide-toned bromide enlargement showing blue-green spots which sometimes appear. Can you tell me the cause and how to prevent or cure them? *L. E. (Tring.)*

It is probable that each spot has as a nucleus a tiny particle of iron, generally in the form of rust. These may be in the bleaching solution, or get on to the print during the washing between bleaching and toning. It has been suggested that two thicknesses of flannel be tied over the tap during this particular process, to filter out any rust particles. It is not impossible, however, that such particles may be present at times in the paper itself.

The spots can be removed with little trouble after the print is dry. Sharpen a match to a fine point, and with this apply dilute hydrochloric acid to the spot. One part of strong acid to three of water will generally work, but it may have to be stronger, even up to equal parts of acid and water. A very small quantity is required.

After applying the touch of acid, blot it off after a moment or two, and repeat this till the spot disappears. When all have been treated wash the print in several changes of water, and dry. No damage is done either to image or paper by this treatment.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

COLOUR FILTERS

The purpose of colour filters and the right ones to use, the amount of extra exposure to give and why, is often a source of trouble to the beginner, and in this article these various problems are dealt with and explained in a simple manner.

THE colour filter, or colour screen, as it is sometimes called, has recently become a much more important part of the photographer's equipment, and this is largely due to the progress made in plates and films. But with the advent of the panchromatic emulsion, which has brought in its wake such a wide variety of colour filters, it has complicated rather than simplified matters for the novice.

The real purpose of the filter and the colour to use has long puzzled the novice, and here a few notes are given which will help to clear up the problem.

Since the colour of the filter to be used depends largely on the colouring of the subject matter, it also depends on the type of negative emulsion used, and it is impossible to understand fully the principle of the filters without at least appreciating the difference between the two types of plates and films that are in popular use to-day.

The more widely used of the two is the orthochromatic or isochromatic variety, the other being the panchromatic, the more expensive kind. Unless the film is marked as being panchromatic it can safely be taken that the emulsion is orthochromatic, even if it is not marked as such.

Oversensitive to Blue.

One of the first characteristics of either type of film that the user notices, is that it is equally sensitive to pure blue as it is to white, so that if a photograph were made of white clouds in a blue sky the blue would appear to the emulsion just as vivid or as bright as the clouds, so that the whole of the sky portion in the negative would be more or less uniformly dense, and that when printed the sky would look white all over with no indication at all of the clouds.

Here the use of a yellow colour filter is advisable, and its purpose is to hold back or absorb everything that is blue, while allowing the other colours to pass through with less restriction. Although, if held to the eye, a yellow glass will tend to make the blue look slightly darker than other colours by comparison, its ultimate effect on the negative emulsion is even more marked. At the same time that the yellow filter is holding back the blue it is also retarding all the other colours a little, and in order to compensate for this we are obliged to give extra time to the exposure.

Multiplication Factors.

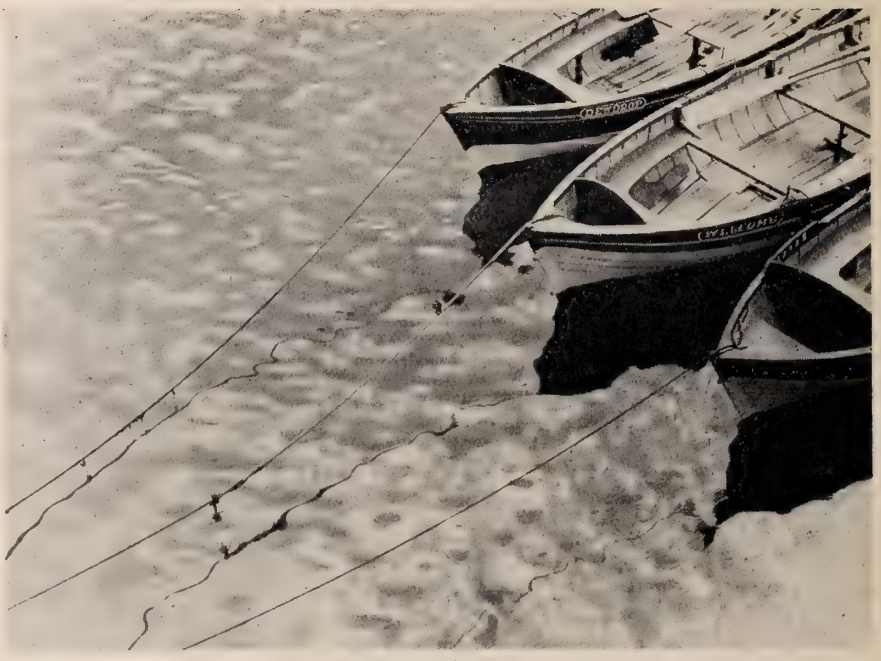
The amount of this extra time depends on the density of the yellow filter with this type of film. For a light yellow we usually give half as much again, for a medium yellow twice or three times as much, and for a deep yellow, one that is very seldom used, about five or six times the exposure that we should give without the filter. Such filters are marked $1\frac{1}{2}\times$, $2\text{–}3\times$, $5\text{–}6\times$. Another form of filter is the graduated sky filter. In appearance it is a piece of glass, half of which is clear and the other half gradually deepening into yellow. It is placed in front of the lens with the yellow portion uppermost, whether the camera is held vertically or horizontally. If the filter is adjustable, the amount of the yellow tint is suited to the amount of sky in the picture.

In one way it is an improvement on the all-over yellow filter as it does not require any extra exposure. The sky, whether it has white clouds and blue sky or not, is usually many times brighter than the ground part of the landscape, so that the yellow part of the filter restrains the sky to the correct degree, while the clear part of the filter allows the lower part of the picture to be exposed in the usual way. The drawback to this type of sky filter is that it is intended for pictures with unbroken horizons, and should any object, such as trees, buildings, or figures, break into the sky the upper part of them will be under-exposed.

Insensitive to Red.

Yellow filters are the only ones that can be used with this type of orthochromatic film. There is, however, one drawback to this kind of film, and that is its inability to record orange and red. If we were to photograph the Union Jack, we should find on the negative that the blue and the white would be fairly dense and dark while the red would be comparatively clear. No filter can help us here since the emulsion is absolutely blind to red. This also explains why some sunsets in which orange and red predominate, are so disappointing when seen in the prints. It is because of its lack of sensitivity to red that we are able to use a deep red light when developing the film.

The other type of emulsion, the panchromatic, is an improvement on the orthochromatic type in that it is sensitive to all the colours—violet, blue, green, yellow, orange and red. Such a film would be the correct one to use on subjects that contained yellow, orange or red, as previously mentioned. The use of a red light for developing is now out of the question, and the only one that can be used is a dark green, to which this film is not quite so sensitive.



Sensitive to all Colours.

It is with this emulsion that green, orange and red filters can be used as well as the various yellow filters. It is, however, like the ortho. film, a little too sensitive to the blue, so that yellow filters can still be used where this colour requires holding back. The extra exposure needed is not so much as with orthochromatic film because the panchromatic emulsion is a little more sensitive to the yellow. That is why a filter which would necessitate three times the exposure when used with an ortho. emulsion would require only one and a half times with a panchromatic film. The green filter gives a slightly better rendering where greens are concerned, such as foliage, etc., but if only clouds against a blue sky are required then a yellow filter is just as efficient. The main purpose of the orange and red filters, as far as the amateur photographer is concerned, is to make the blue sky look even darker, and sometimes this special effect can look very attractive both on prints and on the ciné screen.

Always remember that the entire image has to pass through the filter before it reaches the lens, and that any smears or scratches on the filter will spoil the definition just as easily as they would if they were on the lens itself; it should be treated with the same care that is given to the lens.

Boat and Water STUDIES

By H. EMMETT.

The Three Little Boats.

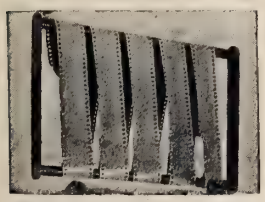
FOR depicting the play of light on water or any subject where light and shade forms the motive of our picture, I think it can be safely asserted that the camera holds first place.

Whenever I go in search of such pictures I always have the feeling that whatever the outcome of my experiments I certainly cannot blame my camera or film, that if they have limitations in other fields of pictorial work, they have none in this line. For the recording of light and shade, delicate tones upon water or boats, the photographic emulsion reigns supreme.

Boats and water studies can be made summer and winter, by the sea, or on inland waters such as lakes, meres or rivers, etc., also they require no expensive apparatus, a box Brownie performing as well as the most expensive type of camera. What is there about a boat that seems to fascinate us? We see people staring at boats, looking them up and down, whether they be on the water or upon dry land. Is it that they suggest to us some shreds of romance or adventure, or is it because of their beautiful shapes, long curves and harmonious lines with which they are built up, and which we know compose so perfectly when placed inside the rectangle of our view-finder? One has only to follow the pages of *The Amateur Photographer* to see what glorious pictures have been made out of boats; often the components of a boat, such as the funnel, keel, anchor, etc., offer sufficient material for the camera artist to make a picture.

A Welcome Interval.

At other times we find sufficient material for a picture in the water around boats, often being enraptured by the play of light upon the waves that lap around the boats.



Sometimes human interest can be combined successfully with a boat and water study, an old sailor sitting in the bows, or a group squatting around in the way that only sailors can.

Whatever our motive be when out making pictures of boats and water studies, there is no doubt that this line of work is one of the most fascinating that can be done successfully with the medium with which we work, viz., photography.

But we must keep an eye on the tone values. There may be deep shadows even on a bright sunny day, and if these are not sufficiently transparent the natural effect will be lost. We must also have high-light detail. Proper exposure and development will secure both.

NEW ACCESSORIES
FOR BETTER PHOTOGRAPHY!

35-mm. FILM DEVELOPING FRAME

Simplifies the developing of Leica, Contax, Retina and all 35-mm. film of similar length. The film, emulsion side out, is wound on the frame and placed in any 10×8 in. developing dish with sufficient solution to cover the film. Price 10s. 6d., post free.

"RHACO" DIRECT-VISION FINDER

When using the Rhaco Finder the camera can be held at eye-level. Price 8/6.

With blue glass lens. Price 10/- Leather Case, 2/- extra.

State make of camera when ordering.

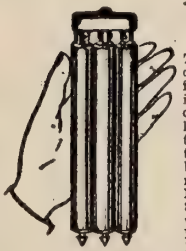
"LEUDI" Exposure Meter

If you trust to luck in photography you are doomed to many a failure. Trust the "Leudi" instead. This tiny exposure meter—by far the smallest, neatest and simplest made—gives you the exact information essential to perfect snapshots. It is just as efficient indoors as out, and can be used with films of any make. Price 5/-. Leather Purse Case, 1/- extra.

"CORREX" ROLL-FILM DEVELOPING TANK

If you wish to make sure of getting the best possible negatives from your holiday films develop them yourself in a CORREX tank. You can develop, fix and wash in daylight without handling the film.

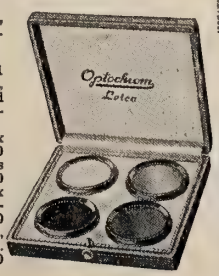
"Correx" Tank for V.P. films.....25/-
"Correx" Tank for 2½×3½ films.....25/-
"Correx" Tank for 2½×4½ films.....30/-
Correx Thermometer (Fahr.).....2/6
Correx Developing Powders, per carton of 6 pairs 1/6



'JUSTODREM' EXPOSURE METER

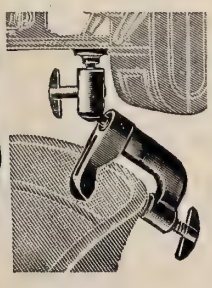
The "Justodrem," an optical meter, savesallcalculations, it shows the correct exposure at a glance. You simply set the meter according to the Scheiner speed of the film to be used.

Price .....15/- Leather Case, 3/- extra.



THE 'WALLET' TRIPOD

This new de luxe quality pocket tripod folds flat when not in use and weighs only 14 oz. It is of light metal contruction throughout, the outer sections being covered in ribbed celluloid. Length when closed 8½ in., 46 in. high when fully extended. In flat leather case. Price.... 21 10 0



SETS OF "OPTOCHROM" LIGHT FILTERS

For Rolleiflex, Leica and Contax Cameras.

Set of 4 filters, 1 each Yellow, Green, Blue and Red, in velvet-lined case.
To fit Rolleiflex lens....£2 5 0
To fit Leica lens £2 10 0
To fit Contax lens, 27-mm. diameter.. £2 0 0
To fit Contax lens, 42-mm. diameter. £3 0 0

THE "RHACO" CAMERA HOLDER

A neat, portable accessory, fitted with ball-and-socket head Can be attached to a fence, gate, tree, table or any other solid support, for supporting any type of pocket camera.

Price.....7/6

Soft Leather Case, extra 2/6

"DIST" DISTANCE Meter

The "Dist" Distance Meter shows exactly the distance of the subject from the camera. The range of the instrument is from 1 ft. 3 in. to 50 ft. Price, in hand-sewn leather case with instructions £2 10 0

"OPTOCHROM" FILTERS

Are supplied in four different colours, for use with panchromatic or orthochromatic roll film. "Optochrom" Light Filters are made of optical glass coloured throughout its entire mass during manufacture. They are not, therefore, affected by heat or damp, as are gelatine filters mounted between glass.

To fit lens mm. diam.	Red, Yellow, Blue or Green.

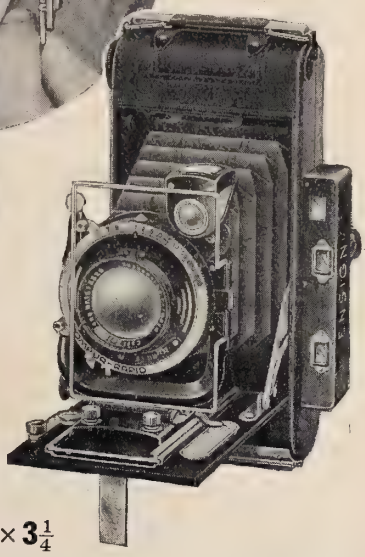
SPEED!

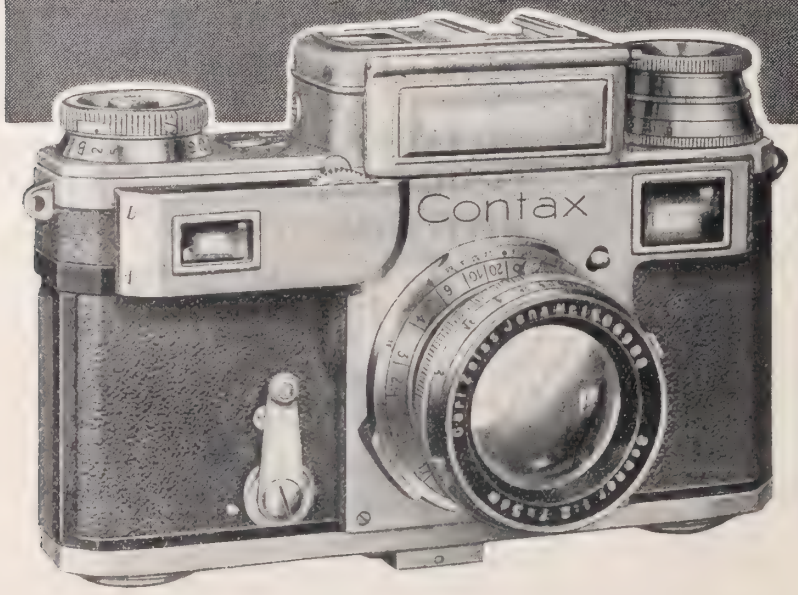


f3.8 ZEISS TESSAR

COMPUR RAPID SHUTTER 400th Sec.

AUTOMATIC FOCUSSING QUICK-ACTION LEVER AND SHUTTER RELEASE BOTH OPERATED WITH ONE HAND

The Camera for Fast Pictures



ENSIGN
SUPER SPEED AUTO-RANGE

FOR PICTURES 2¼ × 3¼

No subject is too fast or too difficult for the Super-Speed Autorange, with its 9 shutter speeds up to 1/400th of a second, and large-aperture lens. The automatic focussing lever is so conveniently placed that the release of the shutter can be made the instant accurate focussing is secured, whilst the camera is held steadily in one hand. Other unique refinements include rising and cross front movements, optical and direct view-finders, and removable spring-loaded film registering device. PRICE **£18:18:0**

ENSIGN, Limited, HIGH HOLBORN, LONDON, W.C.1

Now the CONTAX *with*
BUILT-IN PHOTO ELECTRIC EXPOSURE METER

A Further Development in Miniature Camera Design

IMPORTANT

All Zeiss Ikon Cameras sold by us in Great Britain are equipped with distance and depth-of-focus scales in English feet. Also diaphragm scales are engraved according to the R.P.S. standard.

CONTAX III EXCLUSIVE FEATURES

Built-in photo-electric exposure meter.

●

Choice of thirteen interchangeable Zeiss lenses.

●

Long-base distance meter and view-finder combined in one aperture.

●

Incorrodible metal focal-plane shutter to a real 1/1,250th second.

●

Winding wheel on which all shutter speeds are shown and release button combined.

●

YET another milestone to the ultimate perfection of miniature camera design and construction is marked by the Contax III. This new miniature precision camera, in addition to providing the many important exclusive features of its forerunners, the Contax I and II, is equipped with a built-in photo-electric exposure meter of unequalled accuracy.

The determination of the correct exposure for any given light and film speed has always been a very real difficulty with amateur photographers. This factor is now accurately determined instantly by the built-in photo-electric exposure meter of the Contax III. And since this exposure meter is built into the camera, and is constructed so as to embrace the same angle of view as the normal lens, it provides an accuracy which cannot be equalled by any independent exposure meter. In other respects Contax III does not differ from Contax II.

All enthusiastic miniaturists will be interested in this important new Zeiss Ikon introduction. Full particulars, together with the name of nearest stockist, post free on request.

Readers' Hints, Tips and Gadgets

DEVELOPING SOLUTION ON TAP WITHOUT OXIDATION.

EVERY amateur photographer at some time or another has been up against the loss caused by the developing solution having become discoloured, and therefore useless. The cause of this discoloration is oxidation of the solution by the air, and the longer the developer is stored before use

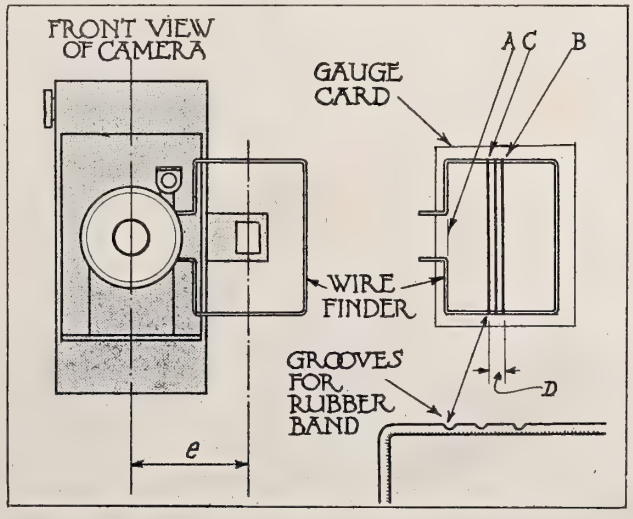
the worse the trouble becomes. For instance, when photographic activities have to be suspended for some reason, and the solution lies idle, then unless precautions are taken to safeguard the solution from oxidation, the entire quantity in store will be ruined.

Various means have been suggested in the past as to how to combat this menace, but they possess some disadvantages. The practice of keeping several small bottles filled to the neck with the solution is quite satisfactory in its way, but this means having to keep a large number of bottles which require extra space, a serious disadvantage to those amateurs who have to work in confined space as that allowed in the small houses obtaining to-day.

The following method has been proved to be a success over a very long period, and it possesses the great advantage that only one bottle is required for storage.

A quart bottle of the coloured variety with a wide mouth is obtained from a chemist, together with a rubber stopper fitting the neck tightly. The rubber stopper should have two holes drilled through it to take lengths of 3/16ths-in. diameter glass tubing. The two lengths of tubing are bent to the shapes shown in the diagram, and the chemist will be prepared to do this for a few extra pence. The tubes are fitted into the stopper in the positions shown in the diagram. The longer of the two tubes should just clear the bottom of the bottle by about $\frac{1}{4}$ in. After the solution has been poured into the bottle, place the lower end of the long glass tube below the surface of the developer, but allow sufficient space at the neck of the bottle to pour in sufficient medicinal liquid paraffin to allow a layer of about $\frac{1}{8}$ in. above the surface of the solution, as shown at A in the diagram. If air be blown slowly through the tube at C the solution will rise in the long tube and pass out at E. When the blowing is stopped the solution will cease to flow, but a small quantity will still remain at the bend B. This will form a "trap" to any air entering at E. In this manner air is precluded from entering the solution either from above or below, and oxidation is thus entirely avoided. When some solution is again required for use, the small quantity held at B is first allowed to run to waste, and as this is quite small, the loss due to waste is negligible. The last sample taken from the bottle is as good as the first.

The liquid paraffin can be used over and over again, and also the size of the bottle is immaterial. D. ALDWYN JAMES.



A PARALLAX COMPENSATOR FOR VIEW-FINDER.

THE frame type view-finder possesses a considerable parallax error due to its offset from the centre of the lens. In close-up work this results in a subject which is seen directly in the centre of the finder appearing decidedly off centre when the negative is developed. A simple but effective method of obviating this defect is described and illustrated.

A rubber band is placed in the centre line of the view-finder and parallel with that edge of the latter which is nearer to the lens A. For long distance views the rubber band will now indicate the centre of the picture appearing on the negative, but for short-range work the rubber band must be moved towards the lens for the same conditions to hold good. The amount of the displacement (D) of the rubber band from the centre line of the finder for a subject at distance (d) from the camera is: $D = \frac{f \times e}{12 \times d}$ where f is the focal length of the lens and e is the distance of the centre of the frame finder from the lens axis. Dimensions D, f and e are in inches, d in feet.

To facilitate quick adjustment of the rubber band a gauge should be marked out on a piece of card of suitable size and shape. A line, A, is drawn on the card near one edge, so that this line coincides with the edge of the finder nearer the lens. A line, B, on the card parallel to A indicates the centre of the finder and therefore the position of the rubber band for long distance subjects. The line C indicates the position of the rubber band for work at, say, three feet, the distance between the lines B and C being calculated by use of the formula given above. Another line, D, drawn midway between B and C now gives the position of the rubber band for work at six feet.

Having the exact measurements of each centre line position, small niches can be filed into the shorter sides of the frame as

shown, so that the rubber band can be slipped into position immediately. F. C. HOWLETT.

Photographing

By C. A. STEVENSON.

A COTTAGE ENTRANCE. *Notice the interesting effect of the strong side lighting.*

ALTHOUGH thousands of snapshots of country cottages are taken every year, especially during holiday time, the enterprising photographer might profitably give more serious attention to these fascinating subjects. The photography of these modest dwellings demands originality; their primitive beauty calls for sympathetic treatment and may be interpreted in an infinite variety of ways.

When the photographer probes the heart of the countryside in search of time-mellowed habitations he enters immediately a romantic world. Nowadays few mediæval cottages remain, but hundreds of a later period, some dating back to Queen Elizabeth's time, still exist. Each type illustrates more or less the life of the ancient peasantry, ranging from the serenity of the cob-built Devon homestead to the hard existence suggested by the old crofter's cot in the Highlands or the mud cabin of Erin.

These cottages, constructed of the material nearest to hand—a fact tending to give character and harmony to the various villages and districts—were built when durability was more important than economy of material. No conscious art guided those early builders, but the simplicity of an architecture so primitive and charming in conception gives to their work to-day considerable artistic value.

A SUSSEX COTTAGE. *A rising lens front is useful for subjects like this.*

A COTTAGE IN SOMERSET. *Another example of effective side lighting.*

A STUDY IN BLACK AND WHITE.

Thatch, the principal roofing of mediæval times, is undoubtedly the chief delight of the cottage photographer. Elizabethan half-timbered abodes and the black-and-white timbered cottages which form the dominant style in Shropshire and other localities—all genuine old English work, solid and unpretentious—are an especially welcome target for the camera. Cotswold cottages, too, although lacking thatch, have attractions of their own—stone gabled roofs, dormers, mullioned casements, and massive chimney-stacks. The camera-man will not be idle here, especially when the golden-grey oölite stone of which these dwellings are built is mellowed by the slanting rays of morning and evening sun.

But a low sun does not always produce the most effective lighting for these cottage pictures. Much depends on the situation of the building and the nature of its architecture.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Country Cottages

An attractive subject for the holiday photographer

Rarely more than once during the day will really satisfactory lighting occur, so that if the subject is exceptionally good the photographer should be prepared beforehand to seize the golden moment.

On some cottages it is impracticable to capture any striking play of sunlight and shadow, but what amount of shadow can be "caught" must be used to the best advantage to emphasise the presence of sunshine in the picture. In some cases, at certain times, neighbouring trees may supply the necessary "atmosphere." Occasionally, their bare branches and frail leaves cast shadow patterns of great beauty on sunlit, whitewashed walls. Indeed, shadows provided by various obstacles outside the picture are often exceedingly useful.

Small portions of cottages, such as gable-ends, windows, doorways, as well as interiors, make intriguing photographs, and their possibilities should not be overlooked by the aspiring picture-maker. Of course, human interest should always be added whenever possible, provided it is suitable in character.

This class of photography presents no untoward difficulties. A light-filter and tripod are sometimes useful, the latter especially, should interiors be attempted.

OLD COTTAGES AT SELWORTHY. *A native or two are useful for street scenes as this.*

A CORNISH COTTAGE. *Where hemmed in by deep foliage as this, a much longer exposure should be given.*

While most of these cottages can be photographed with an ordinary folding roll-film camera, a small plate camera with a focussing ground glass and a rising lens front is undoubtedly superior and will be more accommodating for interiors as well as exteriors, and for close-ups as well as for infinity shots.

Cottage photographs, taken either pictorially or merely as records, are extremely interesting and refreshing to collect, breathing as they do the very spirit of our glorious countryside. An album devoted solely to artistic prints of the most beautiful cottages in England, or one comparing the types peculiar to various districts or setting forth some similar idea, is a valuable source of entertainment and inspiration to one's friends, whether they are keen photographers or not.

A COTTAGE INTERIOR. *Where verticals are in evidence, the camera back should always be vertical, too.*

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

Courses in theoretical and practical photography are to be given at The Westhorne Evening Institute, Westhorne Avenue, Eltham, S.E.9, and the Men's Evening Institute, Vicarage Road, Plumstead, S.E.18. In each case the instructor is Mr. G. R. Hawley, and the fees are merely nominal. Enrolment week commences on September 21st.

We have received from Link House Publications, 4–8, Greville Street, London, E.C.1, three books of special value and interest to the amateur cinematographer. The scope of each volume is suggested by the title: "Exposing Ciné Film," by P. C. Smethurst; "Ciné Titling Simplified," by Harold B. Abbott, and "Trick Effects with the Ciné Camera," by H. A. V. Bulleid. The volumes, well printed and illustrated, are published at 2s. each, post free 2s. 2d., and may be obtained through dealers, or direct from the publishers as above.

A fully illustrated descriptive booklet about the Voigtlander Rangefinder Bessa camera has been issued by the British agents, Messrs. Schering, Ltd., 188–192, High Holborn, London, W.C.1. Our readers may obtain a copy on request if their dealers do not happen to have it in stock. The prices of this excellent camera are very reasonable, and it is worth the consideration of those seeking for a good instrument taking eight or sixteen pictures on $3\frac{1}{4} \times 2\frac{1}{4}$ roll film.

The Agfa Final fine-grain developer which has been on the market for some time in powder form is now available in concentrated liquid in various size bottles. On test with a fine-grain film, it gave an extremely fine grain capable of giving twenty diameters' enlargement without grain structure becoming obtrusive. The liquid form retains all the good features of the powder type, and even after dilution will keep for two months. It can be used repeatedly, and only after a few films have been developed need a slight increase of time be given. Just as suitable for dish development as well as for tank work, it produces warm-black tones on the negative and does not require extra exposure to produce full contrast. Obtainable from all dealers or from Agfa Ltd., 1/4, Lawrence Street, London, W.C.2, at the following prices: $\frac{1}{4}$ litre (9 oz.) 5s. 4d., $\frac{1}{2}$ litre (18 oz.) 10s. 3d., and 1 litre (36 oz.) 18s.

In connection with the society known as "The Men of the Trees," a new magzine entitled "Trees" is to be published six times a year, the first issue appearing on October 1st. The price is one shilling per copy, and the minimum subscription to the Society is five shillings. A special offer is open until September 30th. Those who send 7s. 6d. to the Hon. Secretary, "Men of the Trees," 10, Victoria Street, S.W.1, can secure a year's membership, a member's badge, and six issues of the magazine.

Stolen.—Automatic Rolleiflex, $2\frac{1}{4} \times 2\frac{1}{4}$, No. 227224, Zeiss Tessar f/3.8. Information to Mr. M. King, 39, Upland Road, Selly Park, Birmingham.

The weekly winner in the Wallace Heaton competition is Mr. A. F. Stoop, Hartley Grange, Hartley Wintney, Hants. Readers should note that all communications for Messrs. Wallace Heaton should go to 127, New Bond Street, W.1.

"Floodlight" is the title of a new magazine published for the ciné group of the South London P.S. It runs to thirty-four pages of well-printed and well-written articles, and by some extraordinary device is issued gratis. This privilege is not confined to the members of this particular society. Other ciné societies, and even individuals, may obtain a copy, while the supply lasts, merely by sending postage to The Editor, "Floodlight," 31, Dulwich Village, London, S.E.21. It is a chance not to be missed, especially as it provides a good example for the running of any club magazine.

An attractive little camera that is well worth the attention of all amateurs seeking a new miniature model is the "Roll-Op," marketed by Garner and Jones Ltd., of 29/30, Polebrook House, Golden Square, W.1. This camera is constructed to take sixteen exposures, $2\frac{1}{4} \times 1\frac{3}{4}$ on the standard $2\frac{1}{4} \times 3\frac{1}{4}$ roll film. It is small and neat in appearance, measuring $5\frac{1}{4} \times 4 \times 1\frac{3}{4}$ when closed. The front is self-erecting by pressure on a stud, and it is fitted with a range-finder coupled to the focussing, and has an automatic film numbering device in addition to inspection windows in the back of the camera. This automatic numbering device serves the dual purpose of readily indicating the films exposed and locking the winder after each exposure. By using this counter it is not necessary to inspect the numbers through the red window at the back. The range-finder is very accurate, and there is an additional direct finder for use adjacent to it. The focussing is effected by movement of the complete front carrying shutter and lens. The shutter is the Compur Rapid D.A., giving T. and B. and exposures from 1 to 1/400th sec. The lens is the Plaubel Anticomar anastigmat, working at f/2.8. It is a very strongly made camera, with plated metal work and leather covered. The price is £21.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, August 19th.

Southampton C.C. Outing to Cadnam. E. C. Lomer.

Thursday, August 20th.

Bury P.S. Combination Enlarging. H. Mills.
Camberwell C.C. Bankside Ramble. J. H. Clark.
Hammersmith Hampshire House P.S. Practical Picture Points. A. J. Milne.
Kinning Park Co-op. C.C. Evening Outing to Kelvingrove Park.
Medway A.P.A. Facts and Fancies at Camera Cottage.
N. Middlesex P.S. General Discussion.
Oldham P.S. Monthly Meeting. Bi-monthly Prints.
Oldham Equitable P.S. Committee Meeting.

Friday, August 21st.

Sheffield P.S. Beauchief. Meet Abbey Lane. Mr. Corby.

Saturday, August 22nd.

Accrington C.C. Wiswell Moor.
Bath P.S. Ilford Manor and Freshford. Mrs. Noel Harbutt.
Beckenham P.S. Hampton Court. T. E. R. Terry.
Bolton C.C. Ashworth Valley. S. Lever.
Bradford P.S. Barden. W. H. Womersley.
British Photographic Fellowship. Richmond and Kingston.
Bristol P.S. Brockley and Goblin Coombe.
Dennistoun C.C. Uplawmoor. A. Buchanan.
Hackney P.S. Outing—High Beech. W. Selfe.
Ilford P.S. Essex Outing. Mr. Vinten.

Saturday, August 22nd (*contd.*).

Kinning Park Co-op. C.C. Outing to Cumbernauld.
Sheffield P.S. Ashopton. W Marshall.
Singer C.C. Luss. J. Robertson.
Stafford P.S. Stowe by Chartley. J. Weaver.

Sunday, August 23rd.

Blackpool and Fylde P.S. Shard Bridge for Dishdolls.
Blackburn and D.C.C. Slaidburn. T. Cookson.
Medway A.P.A. Leeds. H. Wingent.
York P.S. Durham.

Monday, August 24th.

Oldham Equitable P.S. Talks for the Holiday Work. W. Miller.
Southampton C.C. Amateur Portraiture Evening at the Club.

Tuesday, August 25th.

Blackpool and Fylde P.S. Meeting at Headquarters.
Hackney P.S. Print Competition.
Manchester A.P.S. Gevaluxe. Jas. Shaw.
Reading C.C. Competition Evening. "Humour Captured by the Camera."
Swansea and D.C.C Print Criticism.
Wood Green P.S. Debate.

Wednesday, August 26th.

Rochdale P.S. Holiday Experiences.

Every picture in your album will be perfect if you always print your negatives on

SELO PAPER

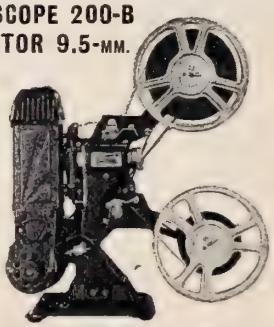
MADE IN ENGLAND *by* ILFORD LIMITED : ILFORD : LONDON

The WESTMINSTER WAY . . . .

If it's anything Photographic (Ciné or 'Still') . . . . . "Get it at the WESTMINSTER ; you cannot do better." Such is the advice of many . . . and for many reasons. But they all boil down to . . . . just the inimitable Westminster way of doing things ; of ***serving and satisfying*** their customers . . . especially in matters like Exchanges and Out-of-Income Buying . . . in everything. Of course, experience teaches.

A few only left—BUY NOW!

ZEISS IKON 4-FOLD TRIPOD



Polished Maple-wood, self-locking clips, revolving top. 17½ in. long closed ; open 50 in. Weight 24 oz. Cost 35/-

Our Price 15/9

Canvas case 5/3. Postage 6d.

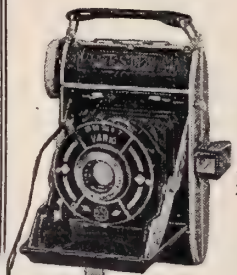
PATHESCOPE 200-B PROJECTOR 9.5-MM.

Fitted with highly-efficient 250-watt direct lighting system, giving a brilliant screen picture 10 ft. wide. Flickerless projection. Very compact. Fan-cooled and asbestos-lined lamp-house. Simple threading. Universal tilting movement. Motor rewind for use on A.C. or D.C. supply, complete with lamp and motor drive for use on 100-volt circuit, 300-ft. empty reel and flex..... **£15 : 0 : 0**

Nine monthly payments of 35/-

Resistance for use on voltages 200 to 250, extra..... **£1 : 15 : 0**

NEW ZEISS IKON CONTAX II and III



Exclusive Zeiss Ikon wedge-type distance meter now combined with view-finder. Shutter speed increased to 1/1,250th, all speeds always clearly visible, delayed action release.

F/3.5 Tessar..... **£40:10:0**
Nine payments of 84/6.
F/2.8 Tessar..... **£43 : 5 : 0**
Nine payments of 100/9.
F/2 Sonnar..... **£50:10:0**
Nine payments of 117/10.
F/1.5 Sonnar..... **£65:15:0**
Nine payments of 153/5.

CONTAX III

Incorporating photo-electric exposure meter and combined range- and view-finder..... **£63**

● Typical WESTEX Values

THE 'WESTEX MINIATURE'

A most efficient high-precision camera at a marvellously low price. 16 pictures 4×3 cm. on standard V.P. spool. Splendid results, easy manipulation. Quick, self-erecting front, f/4.5 Vidanar anastigmat lens, focussing down to 3 ft., Vario shutter, 1/25th, 1/50th, 1/100th sec., T. and B. Direct-vision optical finder. Beautifully made. Very compact, slips easily into your pocket.

Price (as above)..... **£3: 12: 6**

Nine monthly payments of 8/7.

With Radionar f/2.9 anastigmat and Prontor shutter, 1 to 1/175th sec., T. and B..... **£5: 12: 6**

Nine monthly payments of 13/2.

KEYSTONE 750-watt 16-mm PROJECTOR

Greatest Value yet

2-in. large-aperture projection lens, motor drive, forward and reverse, Clarostat control, special still device, 750-watt lamp, super optical system for added brilliance, fin-cooled lamp-house. New improved double-claw action, screw tilting, geared rewind, simple threading. Complete with resistance, splicer and carrying-case, at phenomenally low price of **£36:10:0**

Nine monthly payments of 85/1.

NEW MAGAZINE CINE-KODAK

Remarkable Production.

Charger loaded in 50-ft. 16-mm. film in 3 seconds. Film instantly interchangeable, e.g., Kodacolor to black-and-white, and vice versa, without any loss of footage. F/1.9 Kodak anastigmat, option of four telephotos 2 to 6 in., universal finder. Ask for full description, or call and see. Complete in leather case.

£40 : 0 : 0

Nine monthly payments of 93/4.

NEW 1936 "DEKKO" CINÉ CAMERA

For 9.5-mm.

With 20-mm. Dallmeyer anastigmat (fixed focus), interchangeable mount, variable speeds, half to normal and slow motion, 64 pictures per sec., single picture device, spring drive motor taking full 30 ft. at one winding, built-in telescopic finder. Body of wear-resisting Bakelite, outside fittings, film gate chromium-plated **£6:18:6**

Nine monthly payments of 16/2.

F/2.5 Taylor-Hobson anastigmat (fixed focus) **£7:16:6**

Nine monthly payments of 18/3.

F/1.9 Dallmeyer, with micrometer focussing **£10 : 18 : 6**

Nine monthly payments of 25/6.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXLVII.

Mrs. K. M. PARSONS.

From information communicated to our Special Representative.

"ALTHOUGH I have owned cameras of sorts for many years it was only fifteen months ago, when my husband bought a Rolleiflex, that I turned seriously to pictorial photography. He had to buy another camera for his own use, and I emerged from the dark-room with a print which I decided to send to 'The A.P.' Beginners' Competition. To my astonishment it was awarded a prize, and copies of it have been 'hung' half a dozen times in the last year.

"My favourite subjects are 'pictures in the sky'—that is, trees or leaves against clouds. These cannot be planned in detail beforehand, and are frequently the reason for abandoning household duties and rushing into the garden. Composition in these exposures is difficult, for on most occasions a delay of a few seconds results in a change in the cloud forms. What I aim at is a satisfactory 'pattern,' and perhaps the sound training in design which I was fortunate enough to undergo when young is a help to me in quick appreciation.

"Usually I employ a medium yellow filter for clouds. The percentage of useful negatives—low in all subjects—falls to a minimum in this class, owing to the speed at which one has to work.

"Counter-light on young leaves is also a favourite subject, and I am already looking forward to the few days of next spring when, in the lovely beech woods near Reading, there will be material in embarrassing abundance.

"Most of the landscapes I have were done in the north of Scotland and on the Quantock Hills. During the long rides to these places I did more or less decide what I wanted to do, and on arrival did it.

"I always use Agfa Isopan fine-grain roll film, and an electric exposure meter, my object being to give such an exposure as will, when the film is developed in a tank, give the same printing quality in each negative. By varying the indicated exposure according to the subject, this can be done in most cases. Taking the film speed at 26 degrees Scheiner, and allowing for the filter, cloud subjects are given the exposure shown on the meter; landscapes with medium light and shade, twice this; and so on.

"Development is by tank, Tabloid fine-grain developer, one tablet of each and one of sodium sulphite in each four ounces of water—all filtered. The time is 25 minutes at 65 degrees. I am firmly of the opinion that *exposure* is the vital thing, and that development should be a standardised chemical process. But I do wish I could find a tank that could be guaranteed not to scratch or mark the film in any way.

"For enlargements I rely principally upon Kodak Royal Tinted, medium or contrasty—seldom the softer grade; condenser enlarger; and two or three test pieces on different parts of the negative. These give me not only the general exposure but an idea of what is required in those parts where local shading is indicated. One of these pieces, in a cloud subject, is always on the part that I want to be the most luminous in the finished print.

"Development is in normal Tabloid M.Q. for three minutes exactly, as here again I feel that it is only the exposure that matters. Spotting with water-colour, and the usual turps-varnish-oil dope, complete the operation.

"My prints are usually sent in for *The Amateur Photographer* competitions, and if noticed are then printed rather more strongly, more heavily doped, and sent to one of the exhibitions. Some are also tried out in the two portfolio clubs that I have joined."

SPRING IN BERKSHIRE. *Mrs. K. M. Parsons.*

(*A further example of Mrs. Parsons' work is reproduced on one of the centre Art pages.*)

Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"WANDERERS," *by Sorab J. Kharegat.*

ALTHOUGH the material of which the subject is composed may seem somewhat scanty, and, indeed, may be regarded as approaching the minimum, the picture yet appears remarkably complete, and does not fail to attract and hold the attention.

The reason is that, slight as it may be, the subject matter is very well disposed, both the lighting and the placing uniting to form a good composition, while the spacing is so well judged that there is no suggestion of emptiness, nor is there any impression of inadequacy. The group, with its two figures and animals, forms an effective centre of interest, of which the prime element is the standing figure. The light on his jacket is not only the strongest but also the most considerable mass of bright tone in the picture, and the force of its attraction is enhanced by its contrast with the intense depth of tone in the tree trunk against which it comes.

The interest attaching to this figure is further stressed by the pyramidal formation which the group assumes, the fact that it is the central figure and that the head occurs at the apex of the pyramid lending it an appreciable emphasis. The formation can be visualised in the sketch and, besides the part it plays in conferring pre-eminence upon the principal element, it is also useful in endowing the group, as a whole, with unity.

A further factor, which again is of moment in contributing to the supremacy of the figure, is its placing. This, as will be seen, closely approximates one of the points of intersection formed by divisions of thirds, vertically and horizontally, the points in question forming the conventional strong positions for the placing of the chief object of the material. With all these several factors contributing towards its significance, the importance of this figure is rendered unquestionable, and, with the centre of interest so strongly defined, the prime function of the arrangement—that of ensuring a unity of appeal in the picture as a whole—is achieved.

But the feeling of unity is amplified by the support given to the figure in chief by the other figure and the animal on the right and by the enclosure of the group within the outline of the pyramid. These factors are, it is true, interdependent, but they have their different effects, although, naturally enough, the one could not exist without the others.

Insomuch, the arrangement is admirably contrived, and the introduction of the tree, besides forming an attractive portion of the setting, also is of service in that it connects the upper and lower parts of the picture and identifies the group with the whole.

On the other hand, the depth of tone in the darks appears to be somewhat overdone, it being impossible to distinguish clearly whether there is another animal or an out of the ordinary outgrowth of the tree! The clouds, too, are inclined to be rather woolly in formation, are unrealistic in their heaviness of tone, and, in the upper reaches, almost approach the solidity of the tree branches with which they practically seem to come into contact. With some of the cruder forms of engraving, such as lino or woodcuts, such a representation might be tolerable having regard to the limitations of the media, but, with photography, these limitations are not applicable. It is capable of rendering the most subtle differentiations of tone, and, indeed, has to be forced, by incorrect or ill-advised treatment, to do otherwise.

The depth to which printing has been carried, for one thing, appears to be too great, and, for another, it is doubtful if the character of the printing paper is altogether suitable for the contrast of the negative—the indications being that a paper of softer characteristics is required.

It is possible that both depth of printing and the type of paper have been deliberately adopted with the idea of attaining richness of quality. Quality, however, does not involve heaviness but rather a full roundness of tone and harmony within the limits of the chosen scale, each shade or variation in value being definitely and decisively rendered. It also implies a truthful accord with what our visual impression of the subject is or ought to be, which may or may not involve a departure from actual truth of representation.

Whether it does or not, no apparent conflict with realism can be allowed to appear without losing some of the essential quality of the medium, a fact which becomes increasingly evident as experience extends, and one which is religiously observed by the foremost exponents of the control processes. PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

IT might be thought that, having obtained a creditable reproduction of the reflections, ostensibly the motive of No. 1 of the prints on the opposite page—"Reflections," by Walter I. Phillips—all that was necessary to be done has been done. But that such is not the case will readily be appreciated when attention is drawn to the facts that they only occupy a small proportion of the picture space and the most has consequently not been made of them; the pathway assumes a prominence far beyond its relative significance; and the sky, which should only serve as an unobtrusive part of the setting, is blatantly assertive with its unnatural lack of almost any tone at all.

Pictorial Elements.

Such utter blankness, besides conveying quite an untrue impression of the sky, does not help the picture by any manner of means. If the aim is to make a pictorial representation of the reflections, the sky should not be allowed to assume more than a very slight importance, and, in order that it could satisfactorily be regarded as a portion of the setting, it is essential that it should contain at least a modicum of tone.

Furthermore, the reflections should not only form a more considerable proportion of the available space, but they should be made more prominent by bringing them more into the picture.

With the existing arrangement, it is possible to do no more than trim the print rather drastically. Removing one and a quarter inch from the right, together with three-eighths of an inch from the base, and also five-eighths of an inch from the top, does do something towards improving the present arrangement, but it leaves an awkward triangle of pathway in the bottom right-hand corner; it does not avoid the assertiveness of the sky, although, its area being reduced, its ill effect is not so pronounced; and it does not make the reflections so prominent as they ought to be.

What is really wrong is the choice of viewpoint in the first instance. It looks as though a bit farther along the path and nearer the bridge would have offered something better, the line of sight being directed more to the left. From such a viewpoint, it is likely that it might be found possible to exclude the sky, to include a little of the bridge seen from a three-quarter point of view, and, what is most important, to include more of the reflections, as well as showing them on a more significant scale and bringing them into a better position.

Points of View.

If what has been indicated can be visualised, it will be appreciated by how much the arrangement would be improved, but, if not, references to the way a subject of this type should be treated can be obtained from the reproductions which appear from time to time upon our centre pages.

As far as the sky is concerned, a better rendering can usually be obtained with the aid of a light filter in conjunction with a plate or film that is fully colour-sensitive. Emulsions of the panchromatic type are best, but some improvement can be anticipated, provided the exposure is sufficiently increased, with most kinds of orthochromatic material.

The sky in No. 3, "A Kentish Mill," by W. F. Rowse, provides an instance. The difference it makes is easily to be seen, and, while such a forceful cloud form would scarcely be appropriate in a subject like No. 1, it will be appreciated how a greater depth of tone would advance its pictorial pretensions even in its present form. But, though the sky and the cloud are beautifully rendered, here, it is a pity that the mill was so centrally placed. With the sails on the left-hand side, there should be a considerably greater space on that side than the other, and, if a quarter of an inch were taken from the right and a similar amount added to the left, the position of the mill would leave nothing to be desired.

Skies and the Picture.

Its scale, perhaps, might be a little less, but this would involve a more distant viewpoint, and, necessarily, a retaking of the subject—the opportunity for which, having the sky in mind, is likely to prove very remote.

Both Nos. 5 and 6, "Raphael Park," by F. A. Larner, and "Native Architecture," by Kin Bensusan, are also lacking in a proper depth of tone in the sky, and here, again, a filter would have proved most valuable.

The printing paper, in the case of No. 5, is somewhat too vigorous for the contrast range of the negative, and it is probable that the issue is complicated by this. It may be that a softer grade of paper might offer an improved account of the subject and would enable the sky to show a reasonable depth of tone without overprinting the darks, but this could only be confirmed by experiment.

The same fault—as far as the sky is concerned—recurs in No. 4, "Burscough Abbey," by J. W. J. Jordan. Its unrelieved blankness is highly undesirable, and not only is there an indication of an appreciable over-development of the negative, but a measure of underprinting also exists and a filter could have been brought into service with advantage.

Negative and Print.

The ill effect of over-development could be counteracted, to a considerable extent, by the substitution of a softer or less contrasty printing paper; but it is more than likely that the sky would still prove much too light, and local overprinting seems to offer the only solution.

No. 2, "A New Coat of Paint," by A. Rowbotham, shows a well-caught figure, and the tone in the sky is just about enough to escape adverse criticism; but there seems to be a not inconsiderable amount of fog along the right-hand side, which, apparently, is attributable to lack of care either in loading or unloading the film. If it should be allowed to slacken during either operation, especially if carried out in a strong light, a certain amount of light fog is almost bound to occur along the edges. It is not often that the light penetrates so far into the picture as in this instance; but, as there is no remedy short of extensive retouching, it is a fault that should be carefully guarded against. The camera back should not be opened until the stopping point is seen through the sighting window; the full spool should be securely held while the other is disengaged, and the backing paper stuck down before removal, no slacking off being permitted to occur at any stage.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

SOME ADVANTAGES OF ENLARGING.

A FRIEND of mine was showing me some of his holiday prints and negatives. As he had had the camera for a long time, mainly for annual holiday use, I was not surprised to find that it was a quarter-plate. The D. and P. work was professional, and of average quality.

As I had got some whole-plate prints of the same locality I showed them to him, and he considered that they put his own quite in the shade. I explained that the chief difference was due to the fact that I made my own enlargements from my own negatives; and to prove it I borrowed some of his negatives and made whole-plate prints from them. He was delighted with the results, and would have been more surprised if his prints had been "miniatures" instead of quarter-plates.

In Fig. 1 he had made the mistake, as in other cases, of taking the subject horizontally instead of vertically. Indeed, I noticed that every one of his negatives, whatever the subject, was taken "landscape" way. In this case he had cut off feet and foreground, and given the tall gentleman a partial hair-cut; and, misled by the finder, he had got the group too near to one side. The D. and P. people automatically produced Fig. 1; I modified the result as in Fig. 2. Some of the faults naturally remain, but it is an improvement, and the sheet of paper is obviously used to better advantage by not wasting any on redundant foliage.

We often find that the real subject runs *across* the negative, whether it be horizontal or vertical, so that we should make a vertical print from a horizontal negative, and vice versa. The D. and P. man will not do this except under instructions, and as a special job; and even then we have to be content with his ideas instead of following our own.

Fig. 3 is shown here even smaller than my friend's original print, but the whole-plate print is far more impressive. There are many subjects which are, in their very nature, on the "grand scale," and a postage-stamp record is ridiculously inadequate to convey any impression of their imposing grandeur.

In the picture "6.45 a.m.," in last week's issue, the clearly defined and important figures at the edge of the sea were described by "Mentor" as looking like pinholes on the tiny negative. Therefore they would be black spots on a contact print. Therefore it would be no use looking at the contact print except with a strong magnifying glass, and in real life we do not look at wide expanses of sea and sky and landscape with a pocket microscope. Therefore we must enlarge if we do not want our photographs to be utterly absurd and inadequate.

In Fig. 4 only part of the negative was enlarged, and incidentally the violently sloping sea-line was made all but correct. In the large version the flying birds have acquired outstanding importance and interest, and even their beaks and eyes are clearly defined. One of them was

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

badly blurred and exaggerated in size, and suggested the explosion of a land-mine on the distant cliffs. You will not find him. If we learn to make our own enlargements we can also learn to remove most tragic blemishes.

In other prints I did a bit of shading in parts, emphasised tones in skies and foregrounds by additional graduated exposure, and played the usual tricks which are so easily acquired and are so enormously useful.

I seldom make a contact print, but mainly work to whole-plate. If a negative does not deserve a whole-plate sheet of bromide I do not print from it.

Sessional Programmes

By GEORGE R. BOLTON (*President, Watford Camera Club*).

NOW that a number of club secretaries must be in the throes of arranging their next season's programmes, a suggested *pro forma* for general use may be helpful. If possible, these forms should be stencilled, printing being probably out of the question for the majority of clubs. Such a method of approaching a potential lecturer or a firm on behalf of a trade demonstration obviates a considerable amount of individual letter writing and places all on the same footing so far as details of vacant dates are concerned. The circular suggested is as follows :—

OLDTOWN CAMERA CLUB

SESSIONAL PROGRAMME 1936-37.

Dear.....

The Committee is anxious to make the necessary arrangements for next year's programme of demonstrations and lectures and I shall be obliged if you will kindly let me know whether you can take an evening. When replying will you please give alternative dates, but I will let you know the date finally set aside for you as soon as possible.

The Club meets on Thursday evenings at 7.45 p.m. at its headquarters in the Mechanics' Institute, within ten minutes' walk of either the Oldtown Junction Station or the Newtown Station near the Recreation Ground. The meetings usually close at 9.30 p.m.

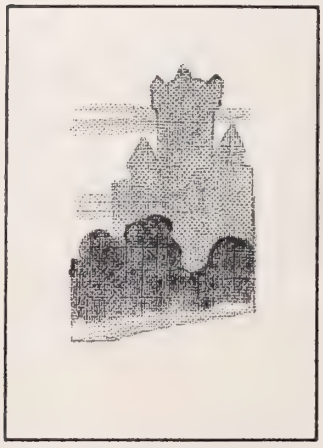
The Club possesses an excellent optical lantern and meets in a fine lecture hall holding about 100 people.

If you can arrange for your ____Demonstration, or Lecture____ on ____"The Chemistry of Photography"____ we shall be most grateful.

The club will pay all reasonable travelling expenses, and will gladly provide light refreshments if desired.

Kindly return this form completed in the stamped addressed envelope enclosed.

Yours faithfully,



JOHN JONES.
Hon. Secretary.

Long Street, Oldtown,

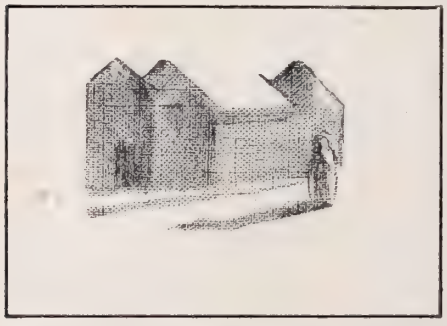
Picture Points

No. 13 (New Series) *by RICARDO*



The Edge of the Print.

ALTHOUGH we have already discussed the weakness and monotony of leaving spaces in the print absolutely devoid of tone and showing only the colour of the paper base, when they appear on the edge they become even more distracting. Each sketch represents a mounted print in which the fault mentioned above appears.

If the tint of the mount approximates that of the paper base of the print we shall get something of this cut-out effect. We are accustomed to seeing landscape subjects with blank paper for skies, but where we have blank roadways, which are so easy to retouch without falsifying tones, we take away the support at the base which is so necessary for good balance.

When the sky-line is similar to that in the lower sketch, with the corners cut away, the print looks as though it had been trimmed round the contours instead of with a straight-edge. In both sketches the straight outside edges of each print have been purposely omitted in order to emphasise the effect.

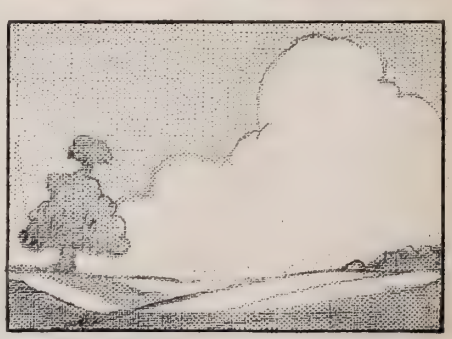
We can use a darker mount, but this is a bad remedy. The cure is to see that the composition, if possible, has no very light tones on or near the edge; but if they are to exist, see that they are toned down a little.

Mass and Tone Arrangement.

IT is only when a subject has been shorn of its attractive colours by the camera and reduced to mere monochrome on a flat surface, we are forced to realise the part that mass and tone arrangement plays. It is extremely difficult to convince the novice in pictorial photography that pin-sharp detail all over the print is not always wanted, particularly if it is a picture that depends on "breadth" and "atmosphere" for its appeal.

If, before we are about to make our next exposure, we examine the subject with half-closed eyes, we shall be relieved of all the fussy detail and see only the broad shapes and tones. If, then, the picture looks just as pleasing, it confirms our first impression, but, more likely than not, we shall see flaws in the arrangement of the subject. The easiest way of learning to construct and balance in mass form is to bring all the varying tones of the print into two or three simple aggregates. A sheet of ground glass, ground side up, on the print will be of great help to visualise the masses and will soften out the detail.

We are then left free to assess mentally the balance of the picture and the arrangement of the various shapes or masses. If we can see room for improvement, a pad dabbed on to some blacklead or dilute lamp-black can be applied on the ground glass over the parts, and will show if further darkening or softening down the light tones will give a better arrangement, without touching the actual print.



The lower sketch shows how the tones of the print are softened down.

The Value of Repetition in Composition.

THE usefulness of repetition in any work of art, whether in graphic form, literature or music, is well known. It is the basic principle of rhythm and, consciously or unconsciously, we employ it in line, form or tone in every picture we make. But like many of its fellow helps in designing and composition, it can be a good servant or a bad master. Unfortunately, nobody can lay down any rules for the correct use of repetition. If it is overdone it can become monotonous and dreary, but if it is cunningly and delicately used, it will give a pleasing design to any subject.

The left-hand sketch shows a form of repetition that is a little too obvious. The contours of the large and small clouds repeat the contours of the trees too closely, whether it so happened that those clouds were exactly that shape in that position, or whether they were selected from some cloud negative, is of no matter. They look *too* carefully placed to be natural. It would be much better to use only one, the larger cloud, and shift it a little towards the centre and vary the position, as well as the number of clouds. Another suggestion is that the cloud be reversed in position and printed on the other side of the picture. We still have repetition of line but, now, differing in direction.

There are countless variations that could be made for even the same landscape, and the only test for any of them, and this applies to all other forms of repetition, is that it should not be so pronounced as to be unnatural and yet be sufficiently strong to form a pleasing design.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Tricks of the Trade

By R. H. ALDER.

No amateur need lament the limitations of his laboratory. It is the simplicity of his equipment which leads him to surpass the professional in imagination.

ON occasion one hears the serious amateur lamenting the poverty of his apparatus—particularly that he lacks an optical printer. Putting aside the fact that a "straight" printer can be built for less than ten shillings, and that thirty feet of stock will furnish enough travelling mattes to make innumerable permutations of screen trickery without optical reduction, the exercise of a little imagination enables the amateur to secure convincingly effects which the professional, to save shooting time, hands to the laboratory.

Let us consider, for instance, the documentary *à la russe*. The scenario is intended to show that the training of Boy Scouts develops a spirit of militarism. Apparently a case for a lap-dissolve from a parade of Scouts to a display of troops in all the panoply of war.

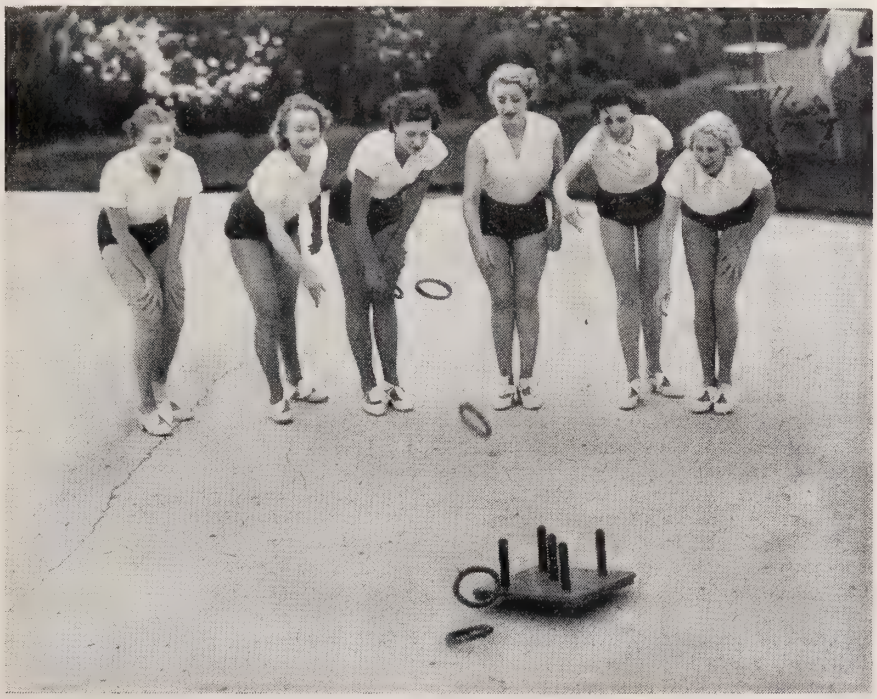
Transition.

Yet it need not be so. Instead, the camera is positioned on the right of the line of march of the advancing Scouts. As they approach, the camera centres on the right marker and swings to the right until he passes, so close as to be an out-of-focus blur. Later the cameraman seizes the opportunity to shoot, from the same relative position, the right marker of a column of troops. Starting close-up, the camera follows him to the right in a continuation of the original swing shot, and the receding column comes into focus, to be seen for what it is.

The same trick has many uses. In less serious mood it can convert the morose crowd on the morning escalator into a line of manikins on the conveyor-belt of a toy factory. Or the camera may pan. off from an expensively-dressed garden-party on to a near-by tree trunk and then pan. from another tree trunk to a crowd of slum children playing in the sun-drenched park.

Sometimes this kind of dissolve is too slow. In a film of the Easter holidays, it was thought desirable to wipe together two newspaper placards, "Holiday Scenes at Hastings" and "More Blizzards to Come." The camera was focussed on the first of these and, by prearrangement, after some four seconds a lady walked between the camera and the placard. The trick was repeated on the second placard from the same angle, but in this case the scene was held for some five seconds after the lady had passed.

Carefully cut together, those shots provide a perfect—and unexpected—wipe. The idea was borrowed from a previous effort in which the close-up waving of a child's Union Jack effected the miraculous decoration with bunting of a rather mean street in the East End of London.



Superposition.

Anything white can be superimposed on an action scene prior to processing. A title, for instance, can be set up in white on dead-black and shot, with a suitable fade-out, on the first few feet of a cassette or spool. In the dark the camera is opened, the film spooled back and the camera closed again. A second exposure—preferably slightly under-exposed—is made on the first scene of the sequence, which is held for a few seconds longer than the title was. Alternatively, the scene can be shot first and, after respooling, the title later.

An approach and recede titler, which enables the operator to obtain apparently expanding and contracting titles, used in conjunction with double exposure, can produce many mysterious effects, but involves some departure from the original idea of imaginative yet inexpensive production.

Rhythm.

The printer is sometimes used to weave a rhythmic pattern without abrupt cutting. For example, in Arthur Elton's saga of the Post Office Savings Bank, dissolves of printing machinery provide a smooth visual counterpoint to the voice of the commentator while he recounts, in figures of astronomical proportions, the numbers of transactions carried through by the bank.

This is the age of sports and games in infinite variety, and they provide many interesting ciné subjects.

A similar emotional effect can be secured by cutting together scenes shot against indeterminate backgrounds, provided the editor forgets for a while the precept to cut on the action and makes each alternate cut on a pause.

For instance, in a documentary film of a market there will be the desk of the auctioneer's clerk, to and from which customers are always moving. Someone approaches from the right and stops. The shot cuts on the moment of rest to another in which a purchaser begins to move out to the left.

Alternate shots of this kind induce a pendulum swing, which can be built up with lengthy shots at the beginning, shortening as the sequence progresses. Within limits angles may be changed on each shot, but the clerk's desk is kept always on the same part of the frame. A fair amount of material is needed to cut effectively the double rhythm of subject movement and camera movement, for the editor is composing a visual fugue.

Cutting on Action.

Visual continuity can be secured by planning for a cut on similar movements. One amateur, who is rather adept at this, revealed that the secret of his success lay in the scratches on his finder, which were intended as frame boundaries for telephoto shots. When he proposed to cut two shots together he used those scratches as guides to ensure that the action should occur in the same point within the frame. Thus he was able to cut smoothly together such shots as a giant mechanical kneader in a bakery with the stirring of batter in a kitchen basin.

Eureka!

It is impossible to detail in one short article all the devices which can be used to secure naturally what the printer does by artifice. Enough has been said to show that the professional who falls back on machinery is merely taking the easy way out. If you are inclined to doubt whether it is worth while to cudgel your brains to invent such schemes, remember that there is no joy so great as that of achievement.

For it was that jubilation which made Archimedes leap from his bath and convert a Greek aorist into an international symbol of success.

KEEPING DOWN EXPENSES

By ARTHUR WELLS.

An Article for users of D. & P. Service.

MANY articles have been written showing how amateur photographers can reduce the cost of their hobby, but they are always for the worker who does his own finishing and are of no help to the great number of summer snapshotters who do not. While the greatest savings can, of course, be made by deserting the D. & P. firms, there are several personal and domestic difficulties that may prevent this and force the photographer to fall back on other methods. The following suggestions will then be found helpful.

Choosing a Film.

Manufacturers of film offer a range of four popular grades, ordinary, 'chrome, very fast panchromatic, and very fine grain panchromatic. The price of the first being only 60 per cent of the price of the last, the wise photographer will not buy a costly film if a cheaper one will do the work satisfactorily, so the subjects to be taken should be considered.

If most snaps will be of friends and records of objects of interest, the ordinary grade of film is quite up to the work. In these days of super-quality film, photographers have lost sight of the fact that the cheapest of the four grades is an excellent film; it is certainly not so much inferior to the 'chrome grade as to make it false economy to buy the cheaper for casual use.

The 'chrome grade and a fairly heavy filter give good renderings of landscapes and sky pictures, though photographers who take a particular pride in their results prefer panchromatic. Of this the fine grain is the better for the button-presser, for the slightly cheaper very fast grade, after development by a professional finisher, often shows such bad grain as to spoil enlargements.

Use a Meter.

The number of pictures that "go wrong" at the moment of exposure is enormous. The greatest trouble is under-exposure. The remedy is obvious, an exposure meter. These can be had at prices ranging from a shilling or so to several pounds, but even the cheapest types are efficient. There is no excuse for incorrect exposure.

Other Precautions.

Other very common causes of failure are incorrect focussing, the accidental use of the wrong stop, and camera movement. All these things are, of course, elementary, yet it is surprising how often one of them is forgotten. Since reduction of expenses demands the elimination of waste, it is a good plan, when all is ready, to check over the vital factors, focus, aperture, and shutter speed.

Always remember the cost per finished negative of the film in use. Finished, fine-grain panchromatic negatives of the popular $2\frac{1}{4} \times 3\frac{1}{4}$ size cost over threepence each, while the cheapest grade cost only a penny less. If this were kept in mind far fewer exposures would be made in the hope-for-the-best spirit that brings disappointment.

A little patience can save quite a lot of money on printing. Do not give the D. & P. firm the usual order "Developed and one from each, please." If you do you will get a print from every negative that can give a recognisable print, whether the quality of the negative, the arrangement of the picture, etc., are as you expected or not.

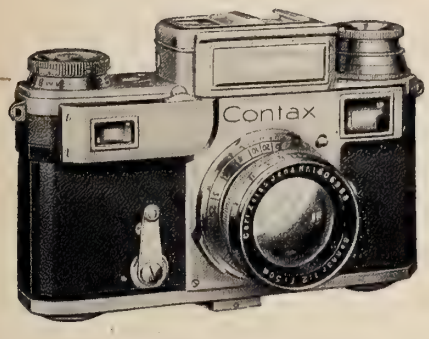
The result is that you collect—and pay for—prints of which you are far from proud and which you do not want. Get your films developed, then examine them and have printed only those you like.

Testing Negatives.

If you are in doubt about the value of some negative, make a daylight print. The paper is cheap (the kernel of the picture can almost always be got on a paper of the next size smaller than the negative), and an efficient printing frame can be made from a piece of glass, a stout card of the same size, and a couple of elastic bands.

When a photograph is not a success do not pass over it as one that "did not come out very well." Hold an inquest and find out why it did not.

The matter of making the camera help to pay for its upkeep by publication fees is hardly within the scope of this article, but it is a point very well worth keeping in mind.



However, fees apart, looking after the pence as described above has enabled the writer to reduce the cost of his "expensive hobby" by a third.

This saving may either be regarded as an absolute one, or, better still, the money expended on further work. It is an easy matter to save the cost of a new spool of film, with its possibilities of scoring successes.

A COMING SALE

In the ordinary course of the part-exchange business we do, we manage to obtain quite a number of cameras other than the miniatures in which we exclusively specialise. The vast majority of these, ciné outfits, hand cameras, reflexes, etc., we dispose of immediately to the trade. There remain, however, a few special outfits which we propose, as we did last year at this time, to offer to the public. We shall advertise these cameras in next week's *Amateur Photographer*, at prices very much below the ordinary market value. No sale lists will be issued and every camera advertised will be actually available on Wednesday morning next. By way of a word in season, we would mention that last year we sold out completely in two days.

CONTAX MODEL III

We have this week received another very small consignment of the new Model III Contax cameras. We have no hesitation in recommending this amazing instrument as the *ne plus ultra* of modern miniature camera perfection. Although embodying an efficient photo-electric exposure meter, the camera has retained the handiness and pocketability of the Model II. The increase in size is negligible.

Prices:
With f/2.8 Tessar lens £55 17 0
With f/2 Sonnar £63 0 0
With f/1.5 Sonnar lens £78 5 0

A UNIQUE PROCESSING SERVICE FOR MINIATURE CAMERA USERS

We are the only firm in Great Britain equipped exclusively to undertake the processing of miniature negatives. We extend our policy of specialisation to the processing side of miniature photography at the suggestion of many of our customers, who, lacking time or facilities to do their own work, felt that a more scientific approach than that represented by the ordinary commercial type of service was desirable. Normally we undertake two types of processing: development in one of the ordinary active types of fine-grain developer and development in a special paraphenylene-diamine developer of our own formula. This latter is carried out in Correx tanks. We are, of course, pleased at any time to employ any particular developer specified by a customer. Particulars and prices on request.

A UNIQUE OVERHAUL AND REPAIR SERVICE OF MINIATURE CAMERAS

We have now installed a well-equipped workshop to deal with repairs to miniature cameras. Repolishing lenses, checking and adjusting shutters, resetting range-finders and general overhauls to miniature cameras are now carried out on the premises by a scientifically trained staff. Our service is prompt and reasonable rates are charged.

PLEASE NOTE.—Repairs to *miniature cameras only* can be undertaken.

NEW FINE-GRAIN DEVELOPERS

Our special paraphenylene-glycin, especially suitable for super-sensitive panchromatic films, per 20-oz. tin, 1s. 2d.
Johnson's "Meritol," 2s. and 3s. 6d.
Supramin, non-poisonous and non-staining paraphenylene-diamine developer, 2s. 4d. and 4s.
Leicanol, a super fine-grain developer of the active type, 2s.
Tetenal Ultrafin SF, claimed in Germany as the finest grain of all developers, 4s. per carton.
Buffered Borax, per 20-oz. tin, 1s.
Eukobrom, Tetenal's new special developer for bromide paper, 3s. 6d.

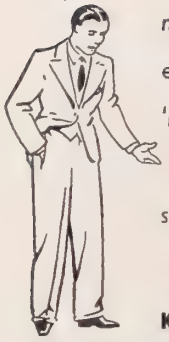
NEGATIVE STORAGE ALBUMS AND FILING SYSTEMS FOR MINIATURE NEGATIVES

1.—Album with five leaves, holding 360 negatives, 5s. 6d. each.
2.—Album with ten leaves, holding 720 negatives, 8s. 9d. each.
3.—Album with fifteen leaves, holding 1,080 negatives, 12s. 6d. each.
4.—Special de luxe model, with twenty leaves and index, holding 60 strips of 6 negatives in transparent envelopes, 17s. 6d. each.
5.—Special box file with 100 cards, each holding 3 negatives and index, 19s. 6d. each.
6.—Special box file with 350 cards, each holding 3 negatives and index, £2 18s. 6d. each.

MISCELLANEOUS:

Contax Model II, f/2 Sonnar lens, ever-ready case. As new.....£39 10 0
Contax Model I, wedge type range-finder, f/1.5 Sonnar lens, ever-ready case. As new.....£39 10 0
Contax as above, but with f/2 Sonnar lens.....£32 17 6
Leica Model IIIa, f/2 Summar lens, ever-ready case. As new.....£34 10 0
Leica Model III, black, f/3.5 Elmar lens, ever-ready case. As new.....£23 17 6
Leica Model II, black, f/3.5 Elmar lens. Excellent condition.....£18 10 0
Leica Model I, f/3.5 Elmar, non-interchangeable. Good condition.....£7 18 6
Automatic Rolleiflex, 6×6 cm., f/3.5 Tessar, Rapid Compur, ever-ready case. As new.....£20 10 0
Ikoflex Model I, f/4.5 Novar, Rapid Compur, case. As new.....£7 10 0
Zeiss Super Ikonta, 530/16, f/3.5 Tessar, Rapid Compur. As new.....£19 17 6
Zeiss Super Nettel, f/2.8 Tessar, case. As new.....£17 15 0
Contaflex, f/2 Sonnar lens, ever-ready case. As new.....£55 10 0
Latest 6×6 Automatic Rolleiflex, f/3.5 Tessar lens, Rapid Compur, ever-ready case. As new.....£20 10 0
Latest 4×4 Automatic Rolleiflex, f/2.8 Tessar, Rapid Compur, case. As new £21 10 0
Automatic 6×6 Rolleiflex, f/3.8 Tessar, Compur, ever-ready case. Excellent condition.....£16 15 0
Automatic Rolleiflex 4×4, f/2.8 Tessar, normal Compur, ever-ready case.....£17 10 0
Rolleicord, f/3.8 Triotar, ever-ready case. As new.....£11 17 6
Exakta Model A, f/3.5 Ihagee anastigmat. Good condition.....£11 10 0
Exakta Model A, f/3.5 Tessar. Excellent condition.....£13 17 6
Exakta Latest Lever-wind Model A, f/2.8 Tessar, case. As new.....£19 10 0
Multispeed Exakta, f/1.9 Dallmeyer Super-Six, extension tube, lens hood, universal case. Excellent condition.....£26 10 0
Voigtlander Superb, f/3.5 Skopar. As new.....£11 17 6
Ikoflex Model II, f/3.5 Tessar, Rapid Compur, case. As new.....£16 17 6
Latest Improved Model Korelle, f/3.5 Tessar, ever-ready case. As new.....£14 15 0
Baldax, 16-on-3½×2½, f/3.5 Trioplan, Compur. As new.....£5 15 0
Baldi, 16-on-V.P., f/2.9 Trioplan, Rapid Compur. As new.....£6 10 0
Kodak Nagel Pupille, 16-on-V.P., f/2.8 Tessar, Compur, ever-ready case. As new.....£12 15 0
Kodak Nagel Pupille, f/3.5 Elmar lens, Compur, special reflex attachment. Excellent condition.....£12 15 0
Nagel Rolloroy, f/2 Xenon lens, case. Excellent condition.....£10 15 0
Dolly, f/2 Xenon, Compur. As new.....£8 15 0
Miniature Marvel, f/2 Xenon, Compur. As new.....£8 17 6
Weltur, 16-on-3½×2½, f/2.8 Tessar, Compur shutter, coupled range-finder combined with view-finder. As new.....£17 15 0

WE NOW ISSUE A WEEKLY LIST AND THIS WILL BE SENT ON REQUEST.



R. G. LEWIS, The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1
(HOLBORN 4780)
(Two minutes from Holborn Tube Station, in the direction of Oxford Circus.)

Question

"What is the best film to use for general outdoor photography at this time of year?"

Answer

"'Panatomic'—undoubtedly. It is fully panchromatic, renders the colours of the countryside in their true black-and-white relationships, gets full cloud detail. And it has a superfine grain—makes rich contact prints and clear brilliant enlargements however small the negatives. 'Panatomic' is made in Roll Films and Film Packs, and in 35 mm. form for miniature cameras. Get some from your Kodak Dealer to-day."

PHOTO-GUIDE

NEW *Pointers* TO FINER PHOTOS

Here are the first of the *new* PHOTO-GUIDE SERIES—four little books crammed from cover to cover with the information you know you need. Between them they answer every question that has ever perplexed you and put you on the road to real success in photography.

★ 1. **"A GOOD PICTURE EVERY TIME"** explains the rules that govern pictorial composition, tells you how to make every snap an "exhibition" picture.

★ 2. **"SHARP-FOCUS/ACCURATE EXPOSURE"** gives you easily understood and *easily remembered* rules for deciding the correct setting of distance scale, lens aperture and shutter time.

★ 3. **"130 PHOTO-FAULTS"** covers every stage of photography from camera-loading to enlarging, giving the cause and cure for every fault that's ever worried you—or ever likely to.

★ 4. **"TAKING PICTURES AT NIGHT"** will convince you that your camera is capable of incredible achievements, will show you how perfect night pictures can be secured with even the smallest, simplest camera.

Price 1s. 1d. each, or post free 1s. 3d.
The four books 4/6, post free.

Obtainable at all Photographic Dealers.

SANDS HUNTER & Co. Ltd.
37, BEDFORD STREET, STRAND, LONDON, W.C.2

INDOOR READINGS UP TO 120 SECONDS

"TEMPiPHOT"

PHOTO-ELECTRIC METER

An amplifier enormously increases the sensitivity, giving dead-accurate reading for indoor or outdoor photography and ciné work. With amplifier attached it gives readings up to 120 seconds. Can be used with or without amplifier. Amplifier or meter *really do* fit a waistcoat pocket. Ask your dealer to show it you!

TEMPiPHOT Costs 75/-
Amplifier 37/6
Morocco zip-fastener cases for either (if desired), 5/- each.

or write for fuller details and address of nearest stockist from the sole concessionaires:

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Exhibitions and Competitions

CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, August 31. Rules in issue of July 29.

The Amateur Photographer Novices' Competition. Prizes of Roll Film for Novices' Prints. Closing date, September 30. Rules in this issue.

The Amateur Photographer Special Competition, illustrating "Can the Camera Lie?" Entries close September 30.

Wallace Heaton "35-mm. Film Competition." Cash prizes every week. Open to readers of *The Amateur Photographer* only. Full particulars in advertisement page in this issue.

XVme Salon International de Photographie de Bruxelles.—Open, May–October. (M. Maurice Broquet, Secretaire du Salon, Rue du Sceptre, 77, Brussels.)

Salon International de Fotografica de Madrid. (Señor Secretario de la Sociedad Fotografica de Madrid, Calle del Principe, 16, Madrid.)

The Listener. Cash prizes for photographs under general title "Conversation Pieces."—Open July 8–August 25. Entries, Monday morning of each week. (Editor, *The Listener*, Broadcasting House, London, W.1.)

The Folkestone Camera Club, Competition for the best photographs of Folkestone.—Entries close September 30. Cash prizes. (Ernst. F. Davidson, Hon. Secretary, Folkestone Camera Club, Town Hall, Folkestone.)

Chicago International Salon.—Open, July 23–October 4. (Alex. J. Krupy, Chicago C.C., 137, North Wabash Avenue, Chicago, Ill.)

XXXIe Salon International D'Arte Photographique de Paris.—Open, October 3–18. (M. E. Cousin, Secretaire de la Société Française de Photographique, 51, Rue de Clichy, Paris (9F).)

Radio Photo-Club de Spa. IVme Salon International de Photographie.—Open, August 9–30. (M. René Chalsèche, Avenue Marie-Thérèse, 13, Spa Belgium.)

I Salon Internacional de Fotografia de San Sebastian.—Open, August 5–20. (Sr. Secretario General Salon Internacional de Fotografia de San Sebastian, Calle San Marcial, 26, San Sebastian, Spain.)

Forty-fifth Toronto Salon of Photography.—Open, August 28–September 12. (W. H. Hammond. Secretary, Toronto Salon of Photography, 2, Gould Street, Toronto, Canada.)

Museum and Public Library, Maidstone. Exhibition of Nature Photography.—August 15–29. (C. E. Fisher, Museum and Public Library, Maidstone.)

Tweede "Focus" Fotosalon.—Entries, August 10; open, September 12–27. (Focus, Ltd., Fotosalon, Bloemendaal, The Netherlands.)

South African International Salon.—Open, October. (Hon. Secretary, Johannesburg P.S., P.O. Box 7024, Johannesburg, South Africa.)

Royal Photographic Society Annual Exhibition.—Open, September 12–October 10. (Secretary, R.P.S., 35, Russell Square, London, W.C.)

Buffalo C.C. Fourteenth Annual Salon of Photography.—Open, September 6–27. (H. W. Schonewolf, 528, Elmwood Avenue, Buffalo, N.Y., U.S.A.)

Morecambe, Heysham and D.P.S.—Entries, August 19; open, September 9–16. (James F. Levisohn, B.Sc., 5, Douglas Drive, Heysham, Lancs.)

Fotoclub Zagreb. Fourth International Salon of Photography.—Entries, August 20; open, October. (Fotoclub Zagreb, Masarykova II, Zagreb, Yugoslavia.)

London Salon of Photography.—Entries, September 2; open, September 12–October 10. (Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

Lincoln Camera Club.—Entries, September 5; open, October 15–November 12. (Miss E. Redfern, 146, Burton Road, Lincoln.)

XII Salon International de Fotografica, Zaragoza, Spain.—Entries before September 10; open, October. (Secretary, Sociedad Fotografica de Zaragoza, Plaza de Sas, 7, Zaragoza, Spain.)

Third Canadian International Salon of Photographic Art.—Entries, September 10; open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, National Gallery of Canada, Ottawa, Canada.)

Windlesham C.C.—Entries, September 10; open, September 25–26. Classes for members (Beginners, Advanced, Professional, also Open Class). (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

IV International Hungarian Exhibition.—Entries, September 15; open, October 24–November 9. (Secretary, Magyar Amatörfényképezök, Orsz. Szövetsége, Budapest VII, Erzsébet-körut, 9, Hungary.)

Rotherham P.S. Forty-seventh Annual International Exhibition.—Entries, September 21; open, October 14–17. (E. George Alderman, Ruardean, Newton Street, Rotherham.)

Service Co. (London), Ltd., Happy Camp Snaps Competition. Cash prizes.—Entries, September 30, (Service Co. (London), Ltd., 273, High Holborn, London, W.C.1.)

Coronet Midget Camera Competition. Cash prizes.—Entries, September 30. (Coronet Camera Co., 310, Summer Lane, Birmingham, 19.)

Eighth International Photographic Salon of Japan.—Entries close in Tokyo, September 30; open, November (Tokyo and Osaka). (Sec., International Photographic Salon, Tokyo Asahi Shimbun, Tokyo, Japan.)

Photographic Society of America 100 Print Salon. Entries, October 1. Limit 4 prints. Entry fee $1.00, (Dever Timmons, Salon Secretary, Box 216, Cashocton, Ohio.)

The Third Yorkshire Salon, 1936, at Mortimer Gallery, City Hall, Hull.—Entries, October 1; open, October 31–November 30. (Graham Fletcher, Netherlea, Kirk Ella, East Yorks.)

Johnson's "Holiday" Competition. Cash prizes.—Closing date, October 31. (Johnson & Sons, Ltd., Hendon, N.W.4.)

U.P. International Exhibition of Photography, 1936 (Lucknow).—Entries, November 1; open, December 5, 1936–February 4, 1937. (Dr. K. N. Mathur, D.Sc., Hon. Sec., U.P. Amateur Photographic Association, Lucknow University, Lucknow.) Entry forms obtainable also from the Editor of *The Amateur Photographer*.

Tenth International Christmas Salon of Pictorial Photography (Antwerp).—Entries, November 15; open, December 20, 1936–January 3, 1937. (J. Van Dyck, Sec., Fotographische Kring "Iris," Ballaestr. 69, Antwerp.)

Leicester and Leicestershire P.S. International Exhibition of Pictorial Photography.—Open, February 22–March 14, 1937. (H. Foscutt, 19, Doncaster Road, Leicester.)

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. They are printed in either the vertical or horizontal form as shown here, and each is complete in itself.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 × 3, supplied for card index cabinets.

The collection when completed will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index, and are now ready. The size of the box is 5½ × 3½ × 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, S.E.1. Price 2s. 6d.

26.

QUICK DRYING OF NEGATIVES

THE two most popular methods of drying negatives rapidly are as follows.

For Glass Negatives only:

METHYLATED SPIRIT BATH.

After fixing the negative, rinse it for as long as time permits in running water and place it into two or three successive baths of plain methylated spirit. The spirit extracts a certain proportion of the water, and with use itself becomes loaded with water and consequently slow in action. Two or three fresh baths are thus essential for efficiency. The one disadvantage is that it sometimes causes a light scum to appear on the surface.

For Glass and Film Negatives:

FORMALIN BATH.

Wash negative after fixing and place in a 1 to 20 formalin bath for five minutes. This hardens the gelatine emulsion, which can then be dried in hot air, preferably directed by an electric fan. The disadvantage with this method is that any subsequent modification of the image by reducing or intensifying is somewhat troublesome owing to the hardened emulsion.

27.

SUPPLEMENTARY LENSES

BY adding a suitable supplementary lens on to the front of the existing camera lens, we can decrease or increase the focal length of the lens.

By decreasing the focal length a smaller image is formed, but a wider field of view is obtained. When the focal length is increased, a larger image is formed and the field of view is decreased. To shorten the focal length, a positive supplementary lens is used and to increase the focal length a negative lens is used. A positive lens will magnify objects when viewed through it, while a negative lens will cause them to look smaller. All supplementary lenses must be attached close to and central with the existing lens.

To calculate the focal lengths of supplementary lens required (S), it is necessary to know the focal length of the lens in use (F) and the ultimate focal length desired (U).

$$S = \frac{F \times U}{F - U}$$

Example 1. What focus of supplementary lens is required to increase a 5-in. lens to 8-in. focus?

$$S = \frac{5 \times 8}{5 - 8} = \frac{40}{-3} = -13\tfrac{1}{3} \text{ in.}$$

A negative lens of $-13\frac{1}{3}$ in. focal length.

When a negative lens is added and the focus is increased, the effective stop value is lowered proportionately.

Example 2. What focus of supplementary lens is required to reduce a 5-in. lens to 3-in. focus?

$$S = \frac{5 \times 3}{5 - 3} = \frac{15}{2} = 7\tfrac{1}{2} \text{ in.}$$

A positive lens of $7\frac{1}{2}$-in. focal length.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

EXPOSURE METERS.

SIR,—This winter I took with me to China twelve quarter-plate Dufaycolor films (for stereoscopic work) and one of the most expensive photo-electric exposure meters on the market.

The latter I was unable to test before leaving, and judge of my dismay, when on reaching Malta, *homeward bound*, I accidentally discovered that it was reading far too high. Careful tests disclosed the fact that the error was exactly 36 per cent, and, incidentally, it is of interest to note that the three other meters with which the tests were carried out, all well-known makes, differed to a quite considerable extent among themselves.

I am bound to say that the firm from whom I purchased my instrument, on confirming the error in the latter, at once exchanged my meter for another.

However, greatly to my subsequent relief, some 60 per cent of my films proved to be excellent, thanks partly to Messrs. Ilford's careful processing (after they had been warned to expect serious under-exposure), and partly to a much greater latitude in the films themselves than even the makers give them credit for.

I note that recently one of your correspondents stated that he had never seen a coloured stereoscopic transparency. If he were to see some of mine, he would understand what he has missed by not practising the now, alas! seemingly dead, but to my mind most beautiful and satisfying branch of photographic art, the stereoscopic.—Yours, etc.,

DOUGLAS TIMINS.

LATITUDE IN EXPOSURE.

SIR,—In a recent publication Messrs. Ilford state that the latitude of exposure for their Dufaycolor film is not great, being of the order of 8 to 1. Am I correct in assuming that for a hypothetically correct exposure of one second anything between 2.5 seconds (approximate) and .3 second (approximate) will expose the film correctly?

This being the case we are lead to the conclusion that the latitude of exposure for ordinary plates and films is very much wider than 8 to 1.

Personally I would consider an error in exposure of 200 per cent up or down to represent extremes. I have discussed this question of latitude of exposure with various photographic friends who like myself are surprised at the Ilford statement.

Perhaps some other readers have views on this matter.—Yours, etc.,

W. PADDOCK.

THE WATER BOTTLE.

SIR,—I find that the water carafe, commonly found on wash-stands with the tooth glass on the top of it, is quite a useful dark-room accessory. The one I have comfortably holds the fifteen ounces which fills my Correx tank, and the conical shape makes it easy to shake for rapid solution without spilling the contents all over the place. I have marked the 15-oz. level with a piece of rubber surgical plaster, but it is, of course, easy to graduate the carafe to suit one's own requirements.

Possibly this rather insignificant little tip will be of interest to other readers of "The A.P."—Yours, etc., A. H. GALE.

A Prize Competition for Novices

THIS competition is specially for those readers of "The A.P." who are Novices, that is to say, amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups, or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

Our readers who are Novices still have time in which to make their prints for this competition, and the prizes are worth having.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.
The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.
The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.
Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 30th.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices" Competition.

CAN THE CAMERA LIE?—A New Competition

IN the Summer Number of *The Amateur Photographer*, published on July 22nd, a new competition was announced in connection with articles that appeared in that issue dealing with "pictorial inexactitudes." It was demonstrated that by judicious application of the camera, combined with unusual viewpoints, or by double exposures, results were obtained that on their face value appeared to be unreliable.

In this competition, prizes are offered for the best photographic "untruth," but the prints must be quite straight and from untouched negatives. Combination prints, or prints that have been built up by cutting out other photographs and copying, or prints that have been obtained by various "control" methods, are not eligible for this competition.

The prizes are **5 guineas, 3 guineas, 2 guineas, 1 guinea** and **10s. 6d.** They will be awarded for what are considered to be the best efforts in making the camera "untruthful." The negatives of the winning prints and of any others must be submitted for inspection if required. Technical data should also be given regarding the production of the photographs.

There are no other conditions beyond those mentioned above. A special competition coupon, which appears each week in the advertisement pages, must be affixed to the back of each print. The closing date will be September 30th.

Entries should be addressed to the Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and should be marked on the envelope, "Special Competition."

Marigolds.

Close-ups *with the* Camera

By
WINIFRED WILLIAMS.

CLOSE-UPS with your camera! Have you ever tried it? If not, you are missing half the fun of photography and you are losing something that only the camera can give. Too many of us waste time striving after effects better secured by the paint-brush, while we overlook the kind of thing at which photography excels.

No other process can give texture and details of structure in the same way. Very often the actual details are barely visible to the eye, though they play their part in building up the whole effect. The camera captures the details and an enlargement reveals their beauty and interest.

There are innumerable subjects that suggest themselves and they may be found at all seasons of the year, in all kinds of places. Look closely at the crinkled surface of leaves, and the patterns formed by their arrangement; the satiny texture of the flowers; the surface of the seashore and the markings on it; ripples on a pond; a shaggy toadstool; dewdrops and raindrops on plants; fur and feathers; crystals of hoar-frost in winter; spiders' webs and thistledown. All will provide pictures.

To be successful with close-ups the camera must have some method of accurate focussing. If only a focussing scale is available, exact measurements must be made, for poor focussing will spoil the picture. A piece of string with knots at measured intervals is easy to carry and convenient to use, but a camera with a full-sized focussing screen is much the best, as the whole picture can thus be seen, and more perfect focussing is possible.

With many cameras a supplementary lens, a Proxar or portrait attachment will be needed in order to get near enough to the subject.

As most of these pictures will subsequently be enlarged, it is well to remember that plates and films vary tremendously in the amount of grain visible when enlarged. There are plenty of fine-grain films obtainable now, so it is best to choose one of these.

Good cross lighting is imperative for this kind of subject. The differences in relief are small, so that if the light is immediately behind the camera it will cancel out the shadows, whereas side lighting will bring up the texture. Actual sunshine does not matter so much—if it is too strong it gives a harsh result—but a really dull day should be avoided. The important thing is to study the subject from different points of view to see which position best brings out the differences in relief.

There is little need to worry about backgrounds. The foreground is the subject, and it can usually be arranged to fill the picture.

The crumpled leaves of a Savoy Cabbage.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer

Chloro-bromide Developer.

Can you oblige me with a developer that will suit all chloro-bromide papers?
F. E. S. (London.)

The following formula will give good results with most chloro-bromide papers, but, of course, the particular developer recommended by the paper manufacturers is always the best.

Sodium sulphite (anhy.) ..	½ oz.
Metol	18 grs.
Hydroquinone	70 grs.
Sodium carbonate (anhy.)	160 grs.
Potassium bromide ..	18 grs.
Water to	20 oz.

Focussing Lens Mount.

What advantages, if any, are there in using a focussing lens mount in a camera?
C. C. (Forest Gate.)

A focussing mount for the lens being screwed into the lens panel of the camera means that the lens panel and bellows can be locked rigidly in one position only and for this reason it is used on most Press focal-plane cameras. Further, this means that at all positions of the lens, the axis of the lens is always at right angles to the negative. Some workers claim that there is a finer focussing control with this type of lens mount than with any other system of focussing. Many Press cameras use this revolving mount adapted to give visual (and an audible) means of focussing, while the camera is being held to the eye.

Wynne Exposure Meter.

Can you please explain how the Wynne Infallible Exposure Meter works? Why are there two grey tints?
J. G. (Southport.)

This meter works on the actinic principle and depends on the time that the prevailing light darkens the yellow light-sensitive paper that should be visible between the two grey tints. Note the number of seconds (or minutes) that it takes for the paper to darken to the darker grey tint on the right-hand side. Set this time on the outer scale against the Wynne speed number of the plate used. These are marked as F156, F128, etc. This is the only movement of the scale necessary. Lower down on the same scale of plate speeds will be found the apertures, also marked as F45, F39, downwards. Against the F aperture to be used will be found the exposure time to be given. The lighter grey tint is for use when the light is so weak that it would take too many minutes for it to darken to the dark grey tint. Note the time taken for the paper to match the lighter tint and multiply it by four before calculating. Periodically the manufacturers issue a table of plate speed numbers, and this can be obtained, price 3d., from the Infallible Exposure Meter Co., Wrexham.

Developing Times.

How much extra time should I give to an M.Q. developing solution that has already been used once?
A. Q. (London.)

It depends on the strength of the developer used and the amount of negative (area) that has already been developed. In other words, how far has the developer been exhausted? You do not mention if it is intended to develop negatives or papers. The depth or thickness of a negative emulsion is much greater than that of any print, and area for area, the negative would exhaust or use up the developing agent much more than the print. So that, provided oxidation does not enter into it, the same bath of developer could be used to develop a greater area of print surface than it could for negatives. Working on the basis of 1½ oz. of normal M.Q. developing solution to develop one quarter-plate before exhaustion sets in, an eight-exposure 2¼ × 3¼ roll film which has approximately three times the area of silver image, a solution of 4 oz. should be used, and should not be used again if the best results are required. Therefore, if only one quarter-plate negative has been developed in 3 oz. of developer, it is sufficiently strong to develop another, immediately after, without increasing the time. For a bromide print of quarter-plate size, ½ oz. of this same developer would be sufficient, so that no increase of time would be required to develop two consecutive prints of the same size in a 1-oz. solution.

Episcope for Projection Purposes.

What is an episcope for projecting positives?
T. J. G. (Glasgow.)

An episcope (or epidiascope) is a lantern for projecting an enlarged image of any flat surface on to a screen by reflected light instead of by transmitted light, as used with the usual lantern projectors. The illuminant is situated very near to the back of the projection lens mount so as to give maximum front lighting on to the subject, which must be at right angles to the lens axis. The lens must of necessity be of large aperture to compensate for the loss of light by reflection. With the usual projector the light is transmitted through the positive and no great losses are made in this way. Focussing is carried out by varying the distance of the lens and object, and lens and screen.

Red Stains on Negatives.

How is it that neo-coccin dye, which is intended to be used as a retouching tint on negatives and leaves a light red stain, retards the printing light to a greater degree than a red stain of the same intensity on a negative that is the result of a certain desensitiser?
J. T. V. (Ilford.)

If the red stains of both the retouching dye and the desensitising dye are of equal visual intensity and yet, on test, the first requires a longer printing time to produce the same density of image as the second, it goes to prove that the retouching dye absorbs proportionately more of the violet and blue rays of the illuminant, the actinic rays that affect the silver bromide used for prints. That is why the light red stains left by either some desensitisers or some anti-halation backing dyes do not affect the printing time as might be at first supposed. Some other backing dyes leave a green or bluish tint, but do not have any noticeable effect on the printing times, as they transmit the actinic rays almost as well as the clear emulsion.

Drying Roll Films.

What is a safe method of drying roll films quickly?
J. M. (Greenock.)

Make up a 5 per cent solution of formalin (½ oz. of commercial formalin added to 9½ oz. of water) and, after washing, give the film two or three minutes in the formalin bath, which will harden the gelatine. Swab off as much superfluous moisture as possible and dry the film in a current of hot dry air. The big disadvantage of this process is that subsequent reducing or intensifying is rendered more difficult and tends towards uncertainty of results. Do not attempt to dry them by the methylated bath method, as this is intended for glass plates, and usually irretrievably cockles a celluloid base.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS :—

12 words or less.....2/6
2½d for every additional word.

Each paragraph is charged separately.

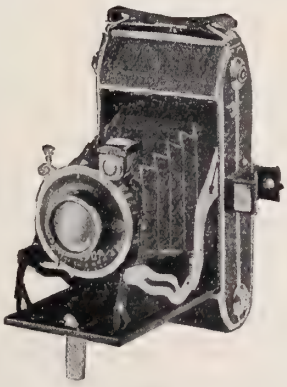
SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue : 13 consecutive insertions, 5% ; 26 consecutive, 10% ; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry ; Guildhall Buildings, Navigation Street, Birmingham, 2 ; 260, Deansgate, Manchester 3 ; 26B, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers



If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

REMARKABLE VALUE

The New NORFOLK ROLL-FILM MODEL

F/3.8 Zeranar, Prontor II Shutter, 8 speeds, with Delayed Action.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer." The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged ; over £10 and under £50, 2/6 ; over £50 and under £75, 5/- ; over £75 and under £100, 7/6 ; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed **& Co.**

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

'SERVICE SUPREME'

ELMAR ACOOS

CHAPTER III.

Being extracts from his diary written in the Mayor's Parlour at Chortle-cum-Hardy.

●

"I have had a very hectic day with Mayor Itchin and the Surveyor on a little matter about drains. Mrs. Smith-y-Smyth, of the Old Manor House, complained of a nasty smell, which we duly had to investigate, and in due course were able to secure some realistic 'Bring 'em back alive' epic pictures of the cause of the bother, namely, 10,000 rats, more dead than alive, underneath the floor-boards in the green room of the west wing. The pictures, taken on the celebrated Kodak Super X film (only 1s. 6d. for 36 exposures for Leica Camera loaded, post free in your own spool-chamber), were remarkable considering the conditions under which we had to work, as only by holding the camera rock steady during the 1/8th sec. exposure at f/3.5 was it possible to get any result at all.

"We had no sooner returned from this expedition, when we were called upon to attend the Vicar's sale of work, a truly rural jollification, which called for intimate snapshots of the Vicar's wife endeavouring to sell last season's raspberry jam to the local grocer (retired). These snapshots were finally enlarged and beautifully coloured by Messrs. Dunscombe's so that the grocer's face was an exact replica of the raspberry jam, in fact, as the Vicar afterwards remarked, it was indeed a very fruity picture.

"The next evening being the Mayor's night off, I accompanied him to the local palace of varieties, and from the first box on the right-hand side we got some excellent shots of the 'bally' dancing, as well as attractive angles of the chorus girls. Prints from these negatives are carried in water-cooled envelopes by the Mayor and shown secretly at the conclusion of council meetings, and are much enjoyed, especially by the Medical Officer for Health and the Sanitary Inspector.

"Whilst the latter mentioned pictures were quite attractive from the standpoint of the subject matter, there was a general tendency for under-exposure, and on my recommendation, Mayor Itchin very kindly arranged for me to have a Summar f/2 lens to augment my equipment, and accordingly an urgent message was sent to Messrs. Dunscombe's, who were able, of course, to supply one immediately from stock, and I am now getting thoroughly acquainted with this desirable lens.

"On Tuesday week my friend the Mayor is attending a Stag Party given by the Town Clerk, and, if rumour is correct, I shall have plenty to occupy my time and attention, and I am hoping that the adventures on this occasion will be worthy of inclusion in my book of memoirs, as, naturally, I can only pass on the high-lights of my daily adventures."

All Leica Lenses and Accessories obtainable by return from

FLIGHT & AIRCRAFT ENGINEER AND AIRSHIPS

The First Aero Weekly in the World

All the latest developments in connection with aviation are recorded in the pages of "Flight."

Illustrated descriptions of new aircraft, aero engines and equipment, British and Foreign, appear regularly, as well as practical articles giving the latest information for Club members and amateur pilots.

"Flight" is the leading authority on aviation. It contains Royal Air Force news, and deals with the work of R.A.F. Squadrons, with Private Flying, and with Commercial Aviation, Airlines, and Airports.

A special staff of highly competent aerial photographers ensures that "Flight" contains the finest photographs of aviation in all its aspects.

EVERY THURSDAY 6d.

From all Newsagents and Bookstalls.

ARE YOU A GOOD PHOTOGRAPHER?

SEND IN A PRINT AND SEE——

COUPON which must be attached to your entry. **WALLACE HEATON** 35-mm. Film Competition. August 26th, 1936.

Open to users of cameras taking 35-mm. film as its negative medium.

The Competition is open until September 30th. Your photographs can be of any subject—but they must be taken on 35-mm. film. Prints should not be smaller than 6×4.

Any number of prints can be sent in in any one week, but each photograph must have on the back a coupon as below, and the name and address of the sender, the make of camera and material used.

In addition to the big prize

A WEEKLY PRIZE OF £1-1-0

will be awarded for the best photograph submitted in that week.

For photographs which appeal to us, not necessarily prize-winners, we reserve the right to purchase the copyright by payment of £2 2s. ; in the case of weekly prize-winners by the payment of an extra 21/-. The copyright of prize-winning prints must be made over to us without further payment. **The picture on the left is a typical prize-winner.**

In addition we are offering a special prize of £1 1s. per month for the best photograph submitted depicting a person or persons using a camera purchased from Wallace Heaton Ltd.

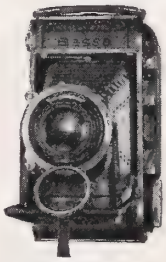
All prints will be judged at the end of the Competition for the final prize of **£25** *cash. Acceptance of these rules and conditions is a specific condition of entry.*

Send in your entries now to 'COMPETITION,'

TO WALLACE HEATON'S 35-mm STILL CAMERA COMPETITION

All users of Leicas, Contaxes, Contaflexes, Retinas, Rolleiflexes and Rolleicords (if used with ciné film) can enter.

for the best photograph submitted during the run of the competition

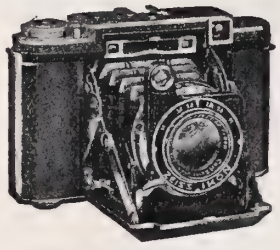


£25 *will be awarded*

WALLACE HEATON LIMITED

127, NEW BOND STREET LONDON, W.1

NEW OR SECONDHAND—BE WISE

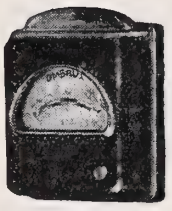


WE HAVE THE LATEST AND BEST OF EVERYTHING, AND THE SECOND-HAND

NEW RANGE-FINDER 'BESSA'

With coupled range-finder and optical view-finder fitted next to the focussing control. The famous trigger release is fitted under the base-board. Yellow filter is incorporated for use when required. Compur Rapid shutter, speeded to 1/400th sec. With 4-element Skopar f/3.5 lens .. **£18:15**

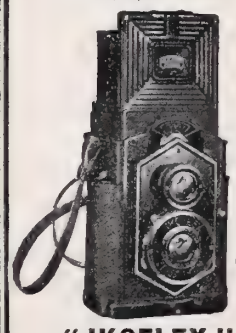
Nine monthly payments of 43/9.



SUPER IKONTA

Takes 12 pictures on 3¼ × 2¼ 8-exposure roll film. Distance meter coupled with the focussing. Direct built-in view-finder, 1935 model, Compur Rapid shutter, speeded to 1/400th sec., film transport, leather bellows, body covered with fine-grain morocco. With f/3.5 Zeiss Tessar lens

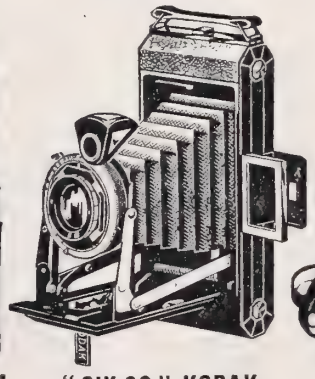
£25 : 5 : 0



Nine monthly payments of 59/-.

"OMBRUX" METER

The photo-electric cell meter with a marvellous lens which makes it the finest instrument on the market at such a price. Gives dead-accurate readings for still camera work. In ever-ready case.



67/6

"IKOFLEX"

The twin-lens camera for 12 pictures on 3¼ × 2¼ 8-exposure roll film. Large finder lens, compensation of parallax, Novar f/4.5 lens, in Ikoflex shutter .. **£7:15:0**

Nine monthly payments of 18/1.

"SIX 20" KODAK

Its Kodon shutter will slice a second into a hundredth. Open the back hinged like a cigarette case, flick up the spool-holders, snap the film home and you're loaded. 8 exposures on 3¼ × 2¼ film. With focussing anastigmat lens f/6.3 **£3 : 12 : 6**

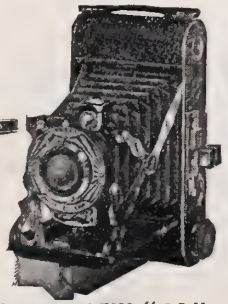
Nine monthly payments of 8/8.

"BRILLIANT"

Takes the standard 3¼ × 2¼ 8-exposure roll film at 1/-, but gives 12 2¼-in. square pictures. The brilliant image shows almost full size. With Compur shutter.

High-grade f/4.5 Skopar lens

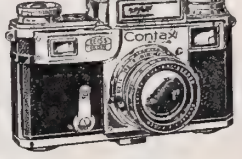
£5 : 15 : 0



Nine monthly payments of 13/5.

T.-P. JUNIOR RUBY REFLEX

Made in 3¼ × 2¼, 4¼ × 3¼ in. and 6½ × 9 and 9 × 12 cm. sizes. With Ruby self-capping time and instantaneous focal-plane shutter. Revolving back, reflecting mirror of specially prepared glass, quick-wind, 3 single metal slides. With T.-P. Cooke f/4.5 lens, size 3¼ × 2¼, from **£12:0:0**



Nine monthly payments of 28/-.

ENSIGN SELFIX "20"

One of the smallest cameras made. Very sturdily built of light metal. Opens like a book to aid simple loading. Strong bellows, reflex view-finder. Trichro shutter, 1/25th, 1/50th, 1/100th sec., Time and Bulb, with flexible release. For standard 3¼ × 2¼ roll film. Ensar anastigmat f/4.5..... **£3:15:0**

Nine monthly payments of 6/11.

THE NEW CONTAX III

with built-in photo-electric exposure meter.

In other respects Contax III does not differ from Contax II.

Fitted with Zeiss Tessar lens, 2-in. focal length.

F/3.5 ..... **£53 : 0 : 0**

F/2.8 ..... **£55 : 15 : 0**

F/2 ..... **£63 : 0 : 0**

F/1.5..... **£78 : 5 : 0**

EASY TERMS & EXCHANGES!

Why not get YOUR camera on our easy plan—nine equal monthly instalments? You can start using your purchase after making the first small payment—pay the balance over a further eight months. Let us have your used camera in part payment—we will make you a good exchange allowance.

MAKE MONEY *with your camera*

We want all types of interesting photographs from everywhere for publication in thousands of newspapers, magazines, etc., all over the world.

Here is a wonderful opportunity for YOU to "cash in" with your camera! Any ordinary camera will do. No particular experience or ability is required to commence this NEW profitable profession in **YOUR SPARE OR FULL TIME.** It is an occupation with permanent MONEY - MAKING possibilities **FOR YOU.**

PERMANENT MARKETING SERVICE FOR YOUR PICTURES

We offer you the unique facilities of our special Marketing Department *—in accordance with our Marketing Agreement.*

By the J. P. D. "Dictograph" Method you will be shown every branch of the profession—from the actual taking, developing and printing of saleable photographs—to advice as to the requirements of editors of newspapers, magazines, periodicals, photographic agencies, advertising companies and other commercial firms.

Also, under our supervision and guidance, successes in prize competitions—regularly conducted by numerous journals—await your best efforts.

CONVERT A FASCINATING HOBBY INTO A WELL-PAID PROFESSION IDEALLY SUITED FOR BOTH MEN AND WOMEN.

You will enjoy the work, it is intensely interesting. You can devote just as much or as little time to it as you wish—we want indoor as well as outdoor pictures taken in rain, fog and snow as well as in sunshine—by day or night, in winter and summer—in city, town, seaside or country, on every day of the year. All suitable photographs are personally submitted to the best markets and highest prices obtained.

The WORD

LEICA

● To all who follow the modern trend in Cameras that word "LEICA" means much. And at each and all of the "Four Westminsters" it has a significance all its own. There, LEICA Cameras and the wide range of LEICA accessories—hardly less notable than LEICAS in themselves—play a very big part in day-to-day and hour-to-hour activities. At any of the "Four Westminsters" you can see and examine the whole LEICA range.

● Go then into any Westminster shop and learn all about LEICAS . . . and EXCHANGING your present Camera, or BUYING OUT-OF-INCOME, which is easily arranged—at the "Four Westminsters."

This is the LEICA Model IIIa, automatic focussing f/2 Summar lens, Shutter speeds to 1,000th. Costs £43, or 9 payments of £5 0s. 4d. (Other models from £16.)

● *Ask about Special Leica "Valoy" and "Focomat" Enlargers.*

Miniature Camera Users!

Enlargements like contact prints

The new Selo films for users of Leica, Contax and similar miniature cameras, set a new standard for fineness of grain.

They yield enlargements notable for clear detail and a sharpness which is almost indistinguishable from contact prints.

SELO H.P. FILM

Fine Grain Hypersensitive Panchromatic

As fast as a fine grain film can be and remarkable for its fineness of grain. It enables difficult subjects with fast movement to be photographed with the certainty that well-exposed negatives capable of enlargement to great size will be obtained.

SELO F.P. FILM

Extra Fine Grain Panchromatic

Definitely the finest grain film produced and intended for the serious and exacting miniature camera photographer who wants perfect negatives of first rate enlarging quality.

These Selo Films are contained in a special Daylight Cassette of patented design which gives greater safety in handling, prevents scratching, and obviates friction.

SELOCHROME FILM

Special Fine Grain Orthochromatic

A splendid all-round film for almost every type of miniature photography by daylight. Anti-halo backed. For the photographer who wants a film of really fine grain at a low price.

Topics of the Week

THE King is recorded as taking a camera with him on his Adriatic holiday, and we learn of his use of it in situations of much interest. We have reason to believe that the King is as adept at photography as he is at many other pursuits. If His Majesty could be persuaded to publish his records in volume form it would be a very interesting gift book for Coronation year, and would enormously benefit any charities he selected. There is precedent for a personal publication of the kind, though not perhaps for a pictorial one. When the late King George V was a young prince on H.M.S. *Bacchante* he with his brother, Prince Albert Victor, published a book made up from their private letters, journals, and notebooks describing the cruise. And there is, of course, Queen Victoria's "Leaves from a Journal of Life in the Highlands." Modern photography makes a royal task of this kind less laborious, more pleasant, and at least equally popular.

Films for Children.

We talked the other day with a man of leisure who, as his bit of social service, takes round his cinematograph projector for 16-mm. and 9.5-mm. films and gives children, especially in poor districts, a treat. His difficulty is to get the right sort of short films, for the stock is soon exhausted, and when he goes week after week to the same schoolrooms the demands of the juveniles may well seem insatiable. There are some excellent films of the kind published by the Dental Board, the Health and Cleanliness Council and similar bodies, and there are again some most ingenious films produced by big manufacturing concerns; but the juvenile audience is quick to detect the propaganda in the one case and the advertisement in the other, however subtly it is conveyed, and if too many of these films are offered it is resented. The G.P.O. films are always popular, as they deserve to be. He tells us also that although such a title as "Farming in Canada" may be received with boos, if there is plenty of action in it the boos soon give place to quietness and an atmosphere of appreciation. The most popular film, which drew an over-flowing audience, was the life-story of a famous cricketer. One drawback is that the Surrey County Council, on the fringe of whose district he works, possibly alone among local authorities at present, requires a licence even for shows of sub-standard film, and this may be a little hampering in the circumstances.

LONDON LANDSCAPES (No. 44).

Looking towards the Guards' Memorial from St. James's Park.

What Photography Cannot Do.

We have been reading the latest edition of "The Modern Movement in Art," by that well-known critic, Mr. R. H. Wilenski, in which he has some hard things to say about photography. In an age when we are always reminding ourselves of the astonishing things photography can do, and coming to believe that there is nothing that it cannot do, it is salutary to our souls to be presented with the other side of the picture. Mr. Wilenski gives a formidable list of things which, he says, the camera cannot do. It cannot comment. It cannot select. The variation between the shortest time and the longest time it can behold its subject is, in daylight, extremely limited. Of course, one might retort that the painter's brush or the etcher's tool cannot comment and cannot select, and that these acquirements belong to the picture-

maker, whatever instrument he uses But Mr. Wilenski would scorn that kind of argument as an unworthy get-away. And he has not done with us yet. Some people, he says, still imagine that the camera can record the forms of physical objects and concrete things, and the formal relations of such objects and things to one another. But these activities are, in fact, beyond the camera's power. Bless us, there is nothing it can do!

The Camera a Poor Thing Indeed.

We had always thought that a camera could at least record a house, a tree, a man, not to speak of the delicate nuances of landscape and cloud, the detail and the general glory of architecture, and even things beyond the range of human vision. But no, says Mr. Wilenski. All the camera can record is the momentary effects and degrees of light as affected by such physical objects or concerte things as a house, a tree, or a man. Its records, moreover, are determined by two accidental physical factors—its own position at the moment of exposure, and the degree of light obstructed or reflected by the objects before it. The camera, in a word, cannot record any relation of physical objects or concrete things one to another except the apparent relations caused by momentary effects of light and shade. Mr. Wilenski goes on to speak in scathing terms of artistic photographers; "hybrid atrocities," he calls their "concoctions." We bow our heads to all this, for Mr. Wilenski is a very able exponent of the new painting. Some examples of the work of modern painters are reproduced in his volume, and we are glad in one or two of these cases that there is a line beneath saying what the subject is. We might otherwise have hesitated as to whether it was a house, a tree, or a man.

Change of Address.

A neat form of photographic advertisement was noticed by our Geneva correspondent the other day. A large photographic firm in a fashionable rue of Geneva has just shifted its quarters to another address on the same street. Thereupon it produced a large photograph showing the street empty of all other traffic and in the middle of it a procession of men, each of whom was carrying some article of the photographer's equipment across the road from the one conspicuous address to the other conspicuous address. It certainly made a very effective poster, and contains an idea which might be imitated by all sorts of firms which desire to bring home to the public the fact of a new location. This particular firm, by the way, claims for its photographs "gout" and "audace." The first word means taste, and the second, daring, but it may mean impudence.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Aerial Focussing.

I understand that there is some way of treating a part of a focussing screen so that it shows a brighter image. Can this be done to existing screens, and is it of any great advantage?
H. B. (Stafford.)

We can give a definite affirmative to both your questions, and will add the necessary information.

The simple adaptation of the ground glass makes possible what is known as aerial focussing. The operation consists in attaching two microscopic cover-glasses to the matte side of the screen. These are circular pieces of exceedingly thin clear glass, and they are stuck down with a spot of Canada balsam. The job is best done by an optician, or someone familiar with microscopic slide-making.

One disc should be affixed at or near the middle of the screen, and a smaller one near one corner. In a quarter-plate screen we use there is a central glass ¾ in. in diameter in the centre, and one ½-in. diameter near a corner. The second is not essential with an anastigmat lens, but is a distinct advantage with one having curvature of field, as the character of both central and marginal definition is clearly shown.

Aerial focussing is facilitated by the use of a focussing magnifier, which is a brass tube in which a magnifying lens of short focus is mounted, with helical or other means of focussing. With a very sharp hard pencil a fine mark is made on the ground glass, and the magnifier adjusted to get a critically sharp image of the mark. The magnifier is then correct for examining the image at the clear spot.

As the end of the tube lies flat on the glass focussing screen, extraneous light is excluded, and the image can be seen even without a focussing cloth. This image is exceedingly clear and brilliant. If the focussing screen is examined in the usual way, with a focussing cloth, and without a magnifier, the whole of the image can be seen, but it is of startling brilliance where the cover-glasses are cemented.

The method is of particular value when dealing with interiors and any poorly lighted subjects, and especially useful in photo-micrographic work where critical definition is of paramount importance.

Good focussing magnifiers can be picked up second-hand at nominal prices, and the cost of cementing a cover-glass is very small, so that it is surprising that even among users of stand cameras aerial focussing has become almost obsolete.

Chromium Intensification.

What is the simplest method of arranging for different degrees of intensification by the chromium process? J. S. S. (Putney.)

There is no difficulty about this if you prepare whichever working bath you require from two stock solutions. These are:

A.	Potassium bichromate	1 oz.
	Water	20 oz.
B.	Hydrochloric acid	2 oz.
	Water to	20 oz.

In preparing A the crystals should be crushed to powder and dissolved in hot water. The acid in B is the "commercial pure" as sold by the chemist. One of the following baths can be prepared, giving (1) strong, (2) medium, and (3) slight intensification.

(1) A, 4 oz.; B, 3 drs.; water, 16 oz.
(2) A, 8 oz.; B, 2 oz.; water, 10 oz.
(3) A, 8 oz.; B, 8 oz.; water, 4 oz.

The washing out of the yellow stain can be abbreviated by first washing the negatives for a few minutes, putting them into a metabisulphite solution, and then continuing the washing.

The strength of the potassium metabisulphite solution is not important. Three or four pea-sized crystals in 10 oz. of water will facilitate the removal of the stain, except, of course, that of the image itself.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

The FREE-LANCE

There is a good deal of romance attached to this title, and many amateur photographers get quite a false impression of what is expected of a free-lance. Some important points are given for consideration.

THE idea that the amateur worker has only to take up free-lance work in order to acquire a fortune expeditiously must be dispelled at the outset. A little thought will show that with the number of professional camera-men available at every function, taking numerous exposures, of which but a few are ever published, there is not much scope for the free-lance, and the chance of his getting a photographic scoop which will bring him in a large sum is very remote.

However, it must be admitted that valuable scoop pictures have been taken by amateurs, but it must also be said that in most cases these were the result of accident. For example, the photograph published in one of the big illustrated papers of the sinking of the Oxford boat in the Boat Race some years ago was taken by a boy who happened to be taking a snap of the race at that particular moment.

The free-lance, if he be wise, will aim at the guineas and half-guineas which are to be had in smaller avenues of the newspaper world. The local newspaper is nearly always a market for these pictures, if they are of the right type, though it must be remembered that even the "local" is nowadays well equipped with staff pressmen, or else is well supplied with pictures from the large agencies should the event be of sufficient interest.

One of the best sources of income is a graphic description of some interesting spot in the vicinity, accompanied by good photographs. Most provincial editors will accept this class of picture, but, in every case, the free-lance should be certain of his facts before he attempts to write about the places of interest, or the result will be a storm of letters to the editor which will effectively put paid to chances of further acceptances.

News Work.

As has been already remarked, photographs of big events are unlikely to yield remunerative results. Here the pressman has all the advantages—he has the right to get into certain positions, a long experience of how to get the best viewpoints, and the most up-to-date equipment to get his print in before any competitors. But there are always minor incidents to be found among these great events. This is the free-lance's opportunity. The tiny weeping child, with the tall policeman bending over her, is the sort of thing even the London news-editor will buy. But it must arrive there quickly. It must possess humanity—indeed, it must absolutely shout human nature if it is to get in at all. Long practice will be required before the amateur free-lance reaches proficiency in getting this type of subject.

Technical Press.

The technical press is probably a much better market for the free-lance, since most technical articles are contributed by free-lance writers, and a bigger market is assured. There is one point about this, however, and that is in making himself proficient in one particular subject the free-lance finds himself neglecting others, and thus, although he gains a more hopeful market, he loses the larger one of general subjects. The technical press demands that the amateur photographer shall portray special features of the particular subject, rather than general work, and in this connection special apparatus will almost sure to be required. Get to know if there are any local journalists who wish for photographs, or can co-operate in the various channels.

Competitions.

An extremely useful line for the free-lance is the newspaper competition. These are numerous at this time of year, and invariably demand some aspect of human nature, for which the worker is already on the look-out. Thus, a subject which may not be topical enough for a news editor will probably be human enough for a competition editor, and even if it brings in only a small prize it helps to keep things going until the free-lance achieves his ambition and becomes a news photographer.

Advertisements.

This is a field which is very often neglected by the free-lance, so intent is he upon newspapers and news pictures; yet there are thousands of firms up and down the country seeking novel pictures which will advertise their wares in an attractive manner. Anything which might serve to impress upon people the beauty of someone's cyder, or even somebody's cure for corns, should be examined by the worker with care. Simplicity is usually the keynote of these pictures, and in this respect the photographic firms should not be overlooked.

Sending in.

It goes without saying that the photograph submitted must be technically good. It should be a little more contrasty than usual, and should be submitted at least whole-plate size on glossy paper, preferably glazed.

In the case of news pictures they should be packed with stiff cardboard and sent off by express post at the earliest possible moment. Should the free-lance get a scoop photograph he should, if possible, ring up the art editor of the journal he selects without delay, and explain what he has. If the editor thinks it is worth the trouble he will arrange to have it collected as quickly as possible.

Postage for return should invariably be included with the prints, and the caption and your name and address placed on the back of each print, written legibly, or, better still, typed on a separate slip and stuck on.

With regard to payment, this is usually left to the editor, who is best able to assess the value of the print, and most papers have a fixed rate for their ordinary pictures. The free-lance need have no qualms as regards his treatment if he deals with established papers.

Press agencies are sometimes recommended as useful for disposing of the free-lance's prints, but it must be remembered that they have many prints to dispose of, and the chances of acceptance are thereby reduced somewhat.

Free-lance work requires an ability to rise above many disappointments, and a self-criticism most severe, but it is quite a practical proposition if the amateur has the necessary courage.

Dartmoor.

Photographing Wide Open Spaces

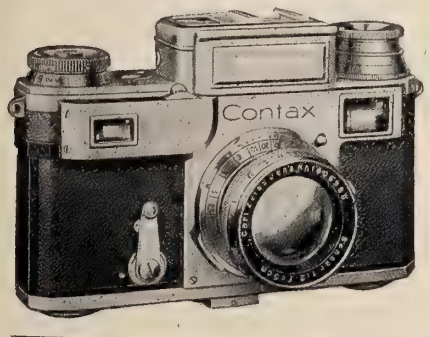
By C. MILLAR DUNCAN.

THAT lovely distant view stretching away down the valley with a tiny glimpse of the sea. How are we going to photograph it successfully with a small camera and one of the 'chrome films used by the average amateur? This is a difficult subject, but therein lies its fascination. We amateurs are always being accused of attempting the impossible, but with this subject some degree of success can be attained, and there are a few points which must be very carefully considered.

The foreground is an important part of any composition containing wide open landscape in the distance, and should always be very definite or the picture becomes vague and pointless. Arrange your foreground to show off the distance to its best advantage, but do not let it obtrude too much or you will find that it is monopolising the picture and so destroying your aim.

Clapham Dale, with Ingleborough in the distance.

The sky, when included, should also be carefully considered to help the lines of the composition. Choose a sky which will throw up the distance as being the most important part of the picture, but do not let it be too conspicuous so as to claim all the attention.



If there are no clouds about and the distant landscape is hilly, the skyline can come very effectively near the top of the picture.

A bright day with a clear atmosphere is necessary for taking such pictures. A low sun adds enormously to the amount of relief which is obtained. A landscape like this will need only a comparatively short exposure. To effect this, stop well down, using a colour filter, or at any rate a sky filter, and give a fairly long exposure. For this type of work a tripod is almost as necessary as the camera itself.

MINIATURE CAMERAS

As is generally known, the firm of R. G. Lewis specialises exclusively in miniature cameras. We stock every miniature camera of repute. Besides the cameras themselves, we have about 500 accessories for the Contax and a similar number for the Leica. We also stock every accessory for the Rolleiflex, Exakta and Super Ikonta; all fine-grain developers and every type of miniature film on the market.

CONTAX MODEL III

We have no hesitation in recommending this amazing instrument as the *ne plus ultra* of modern miniature camera perfection. Although embodying an efficient photo-electric exposure meter, the camera has retained the handiness and pocketability of the Model II. The increase in size is negligible.

Prices:

With f/2.8 Tessar lens **£55 17 0**

With f/2 Sonnar **£63 0 0**

With f/1.5 Sonnar lens **£78 5 0**

SECOND-HAND MINIATURE CAMERAS

Readers of our advertisements will have noticed that our lists of second-hand miniature cameras do not greatly vary in content from week to week. It can, in fact, be taken as a matter of course that at almost any time we can supply second-hand ANY model of the LEICA, FITTED WITH ANY LENS. The same thing applies to the CONTAX (with the exception of the latest Model III), the ROLLEIFLEX, the SUPER IKONTA and the EXAKTA. We propose, therefore, in future to restrict ourselves to mentioning weekly in these columns a few representative second-hand bargains only, and to supplement this with a complete weekly list of all our second-hand miniature cameras and accessories. This will be sent free on request.

When the purchase of a second-hand miniature camera is under consideration, we suggest calling or writing to us about it. All our second-hand miniature cameras undergo before resale the most exhaustive scientific tests. Lenses, for instance, are tested for collimation (parallelism of the plane of the lens with the plane of the film), shutters for speed accuracy and evenness of exposure, range-finders are checked for exact coincidence of images and proper coupling with the lens. A second-hand miniature camera, in fact, may be purchased from us with precisely the same degree of confidence that one would purchase new apparatus straight from the manufacturers.

The following cameras represent a very small selection of our second-hand stock. A guarantee of mechanical and optical perfection accompanies each camera.

Contax Model II, f/2 Sonnar lens, ever-ready case. As new.....£39 10 0
Leica Model IIIa, f/2 Summar lens, ever-ready case. As new.....£34 10 0
Leica Model III, chromium, f/3.5 Elmar lens, ever-ready case. As new....£24 17 6
Leica Model II, chromium, f/3.5 Elmar lens. As new.....£22 10 0
Leica, latest standard model, chromium, fitted chromium range-finder. Cost £20 15s. As new.....£15 10 0
Leitz Valoy Enlarger, as new, £7 15 0. With long upright.....£8 5 0
Ensign Magnaprint Enlarger to take Leica lens.....£3 5 0

CASES FOR MINIATURE CAMERAS.

We make a number of special cases for miniature cameras, details of which are as follows:—

Special Ever-ready Cases, made from finest pigskin, for Leica Model III, with f/3.5 Elmar lens, 27s. 0d.; with f/2 Summar lens, 28s. 0d.; Ditto, to fit Contax Model II, 32s. 6d.

Best Velvet-lined Pigskin Cases, with lock and key, for Super Ikonta 530, 12s. 6d.; for Super Ikonta 530/2, 15s. 6d.

Ever-ready Cases in best hide for Exakta cameras (state whether plate back or ordinary model), 27s. 6d.

—— AND A SALE OF NON-MINIATURE CAMERAS

The cameras described in the following list have been taken in part-exchange for the miniatures in which we specialise. We have carefully adjusted the prices to a level considerably below the ordinary market value. This means that in no case has a profit been made, and in most instances the goods are offered at considerably below the original cost price. No apparatus can be sent on approval, but we have described each article as faithfully as possible. In each case we guarantee the working order. Only high-class miniature cameras can be taken in part-exchange.

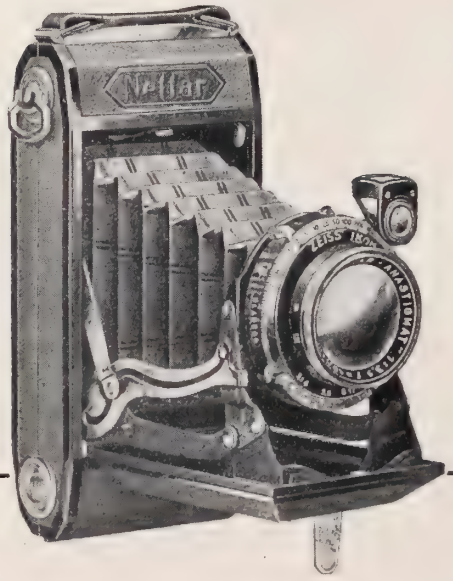
(Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

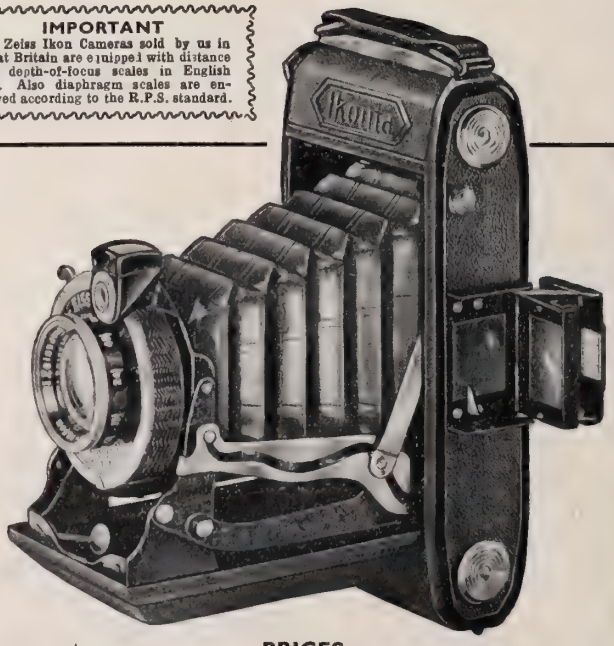


100% Self-erecting

★

The Nettar is made in only one size, for 3¼×2¼ pictures. With Nettar f/3.5 and Compur Rapid shutter (illustrated)

£9 : 10 : 0



Other models with f/6.3 lenses from £3 15 0
Other models with f/4.5 lenses from £5 10 0

Countless opportunities are lost to the amateur photographer who does not possess a really ever-ready camera equipped with a rapid anastigmat. Many imagine that such an instrument must necessarily be expensive, but the Nettar, which springs open at the touch of a button, equipped with Nettar f/3.5 anastigmat—the ideal aperture for both summer and winter work, indoors and outdoors—and Compur Rapid shutter to 1/400th second, costs only £9 10 0.

NETTAR

IMPORTANT
All Zeiss Ikon Cameras sold by us in Great Britain are equipped with distance and depth-of-focus scales in English feet. Also diaphragm scales are engraved according to the R.P.S. standard.

Like the Nettar the Ikonta is 100 per cent self-erecting, and the special two-point setting of focus and stop facilitates matters for the snapshotter. The elegant body of hard aluminium alloy will last a lifetime. The Ikonta can be obtained in four sizes, including the popular economical divided picture sizes. Only really high-class anastigmats are fitted to the Ikonta, while the world-famous Zeiss Tessar f/3.5 is fitted to the smaller sizes and f/4.5 to the larger sizes.

IKONTA

★ **PRICES**

16 pictures 1⅝×1¼ on the usual V.P. spool, Novar f/3.5 lens, Compur Rapid shutter.....£8 7 6
16 pictures 2¼×1¾ on usual 2¼×3¼ spool, Zeiss Tessar f/3.5, Compur Rapid shutter £11 17 6
8 pictures 3¼×2¼ or 16 divided 2¼×1¾, Zeiss Tessar f/3.8, Compur Rapid shutter.....£15 10 0
8 pictures 4¼×2½ or 16 divided 2½×2½, Zeiss Tessar f/4.5 lens, Compur normal shutter £13 0 0

The above is only a small selection showing one camera in each of the available sizes. There is a wide range of shutter and lens equipments available for these instruments.

Most high-class dealers stock Zeiss Ikon products, or full particulars, together with name of nearest stockist, post free on request.

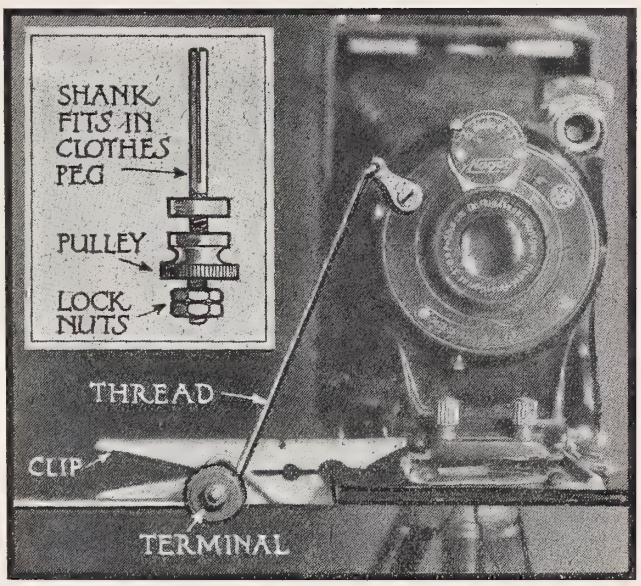
ZEISS IKON LTD., 11, MORTIMER HOUSE, MORTIMER STREET, W.1

Readers' Hints, Tips and Gadgets



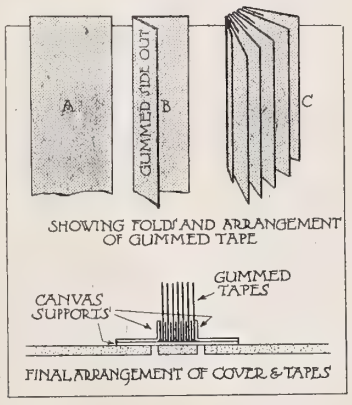
A LONG-DISTANCE SHUTTER RELEASE.

THERE are many occasions when a long-distance shutter release is called for and when even a delayed-action shutter is not exactly suitable. Although there have been several similar devices for releasing this shutter, they are all rather complicated or else tend to jar the shutter.

The gadget here described and illustrated is very simply made and does not involve any complicated trip mechanism, and has little or no friction. As will be seen in the illustration, all that is required is a small wooden spring clothes-peg, that is now so popular, and a radio terminal. It is important that the shank of the radio terminal is a good tight fit in the spring coil of the clothes-peg, and it will be found effective to slit the shank in order to provide a good grip. It is immaterial whether the shank is screw threaded or not. The terminal head, which acts as the pulley wheel, should be a very loose fit on the screw thread and, as can be seen in the smaller illustration, two small lock-nuts are fixed at the end to prevent the terminal head from coming off.

The application is very simple; the terminal is pushed into the clothes-peg and this is clipped on any convenient ledge on the camera. The thread is then secured to the shutter release trigger and slipped under the terminal head, and can thus be extended for any suitable distance. If it is desired to pull the thread in front of the camera, as for self-photographs, it is only necessary to grip the clip in front of the baseboard instead of at the side. When fixing the clip on the camera it is well to see that the terminal head is free to revolve either way to ensure lack of friction.

A. HALLUM.



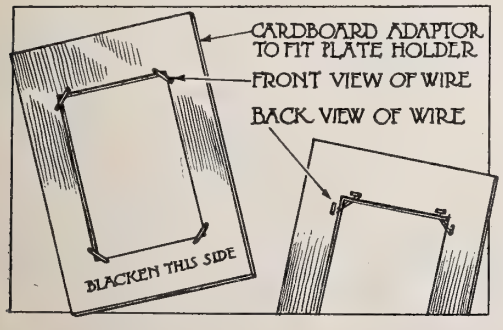
A BOOK ALBUM FOR PRINTS.

MOST photography enthusiasts like to make enlargements of their pictures, but do not know what to do with the enlargements. I bind mine into books of twenty-four. The books described cost practically nothing and can be made at home.

Each picture is mounted by the edge only and therefore does not require a leaf as a mount. Double-weight and single-weight pictures can thus be inserted side by side. All that is required is some gummed parcel tape, which is obtained in roll form, and some cardboard for the two outside covers.

Cut as many strips of gummed paper as pages required, A. Each strip should be almost as long as the upright side of the print or enlargement. Fold each strip lengthwise to give a ¼-in. fold with the gum outwards, B. With all the gummed strips folded they are ready to be stuck together. Arrange them as shown at C, and it will be seen that each folded edge has its gummed side in contact with the gummed side of the next strip. Moisten and stick each fold together carefully and see that they are all uniform. Any number can thus be formed, but in practice, particularly if double-weight papers are used, twenty-four or so will be a convenient number. The back of the book or the "spine" is made out of stout cardboard, the width to be a little larger than the width of the gummed strips, in order to accommodate any thick prints. The two covers, in area a little larger than the largest print to be inserted, should then be bound up with the spine as illustrated. Canvas is an ideal support for this purpose and it will also serve to hold the entire wad of gummed strips at each side. Use good glue for these canvas supports as they are responsible for the life of the entire album.

To insert a print, it is only necessary to moisten a strip of the gummed tape and press the upright edge of the back of the print in position.



This same idea can be adapted to any size of album, even down to a "contact" size.

H. KAY.

SIMPLE DARK-SLIDE ADAPTERS.

IT is often found very convenient to be able to adapt the normal dark slide of the camera to hold smaller sizes of plates or cut films, but sometimes the occasions are so few that they do not warrant buying the commercial adapters. Here is a way of making an adapter requiring only four wire stitches that are found in journals. In a piece of stiff cardboard, cut to the size to fit the usual plate-holder, a rectangular hole in the exact centre is cut to accommodate the plate required. If the end of each wire stitch is bent at right angles, it can be inserted across each corner, as shown, and bent backwards on the other side to secure it. In this way, the exact registration is automatically obtained and the arrangement will be found quite strong enough for normal use. To prevent reflection of light in the camera, the front of the adapter should be blackened. If the adapter is placed on the ground-glass focussing screen, a pencil line round the inner rectangle ensures accurate placing.

ERIC SIDNEY.

MARKETING—with a Camera

An illustrated article by W. L. F. WASTELL.

FOR many years past shops have been becoming larger, showier and more elaborate; they simply yell for attention by day, and make night hideous with their crude coloured lights. But the open-air markets and the "market streets" are very much like what they were half a century ago, unless you take the trouble to note certain changes in the character and quality of some of the goods, and some of the buyers and sellers. You will find precious little change, though, in such objects as cattle and drovers, turnips, herrings, tintacks or cures for bunions.

Open-air markets are scattered all over the country, and most of us are within easy reach of one or more. Many towns and even villages have their weekly market day, and the things bought and sold vary according to the industries and occupations of the locality. Practically all such markets are good hunting-grounds for the photographer, and he will find it an interesting task to compile a set of prints which will give a good idea of the characters and characteristics of the market he selects.

I am illustrating this note with half a dozen subjects taken on market-day at Romford, in Essex. I have two dozen, collected within quite a small area, but I reckon I should want at least fifty to give anything like a comprehensive picture of this one market. A few calves

do not suggest the numbers of cattle, sheep, pigs and poultry gathered weekly from the surrounding country.

Most markets have their outstanding features—live-stock, fish, fruit, grain or whatever it may be; but most of them have, too, their common commodities—things to wear and things to eat.

I hope nobody will ask me what is the "best" camera for market work. I should probably say any camera so long as it is a miniature one, simply because I have taken most of my market subjects with a quarter-plate reflex, sometimes with a lens with as long a focus as 12 inches, and a miniature would probably do the job far more easily.

It would be stretching the truth to breaking point to say that this kind of work is easy. In my experience it requires at least forty-three times the patience of Job. As far as I can see, every market, whatever its wares, is infested by particularly large, sluggish, opaque women; and this makes

pace from that of large women and lean drovers. Everything tends to be crowded, and there is not much elbow-room for manœuvring. I think it possible that there are "pictures" to be made in market places, but I am pleased with the simple and homely records that require no titles or explanatory captions.

me doubtful about the miniature. Even on a quarter-plate, with a normal lens, I have found one such woman and a cod's head fill the entire picture space.

I find that the familiar twenty-fifth of a second is good enough for most market work, and it is often necessary to run down to f/8 or f/11 to get sufficient depth in some of the subjects, which tend to be of the close-up type. If the light is reasonably good there is no need for ultra-rapid sensitive material. Orthochromatic generally serves, but panchromatic is better when fruit, flowers and dress materials are in evidence—as they mostly are.

It must not be supposed that this market work is all slow and leisurely. You must keep your eyes open, and the camera at the ready, for chances of a shot come and go at a different

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

The Hon. Secretary of the Coventry Photographic Club advises us that his address in future will be 68, Morris Avenue, Coventry.

We strongly advise all our readers to obtain a copy of the new "Granville Guide," published by Messrs. Granville Gulliman, Ltd., Leamington Spa. In the first place it is a complete catalogue and price list of the British products of the firm—plates, films, papers and postcards of all kinds and grades, mounts, chemicals, developers and sundries. In addition to all this there are useful formulæ for the different products, with hints on storage and procedure. For making negatives, prints, enlargements and lantern slides it is a handy photographic textbook. Finally, there are full details of exceptionally convenient and economical methods of obtaining any of the goods in large or small quantities from Granville branches, stockists or by post. The firm's twenty years' experience of this sort of business gives the purchaser of photographic material excellent opportunities for perfectly satisfactory service.

The winner of this week's competition organised by Wallace Heaton, Ltd., London, is P. S. Milne, 58, Turkenstrasse, Munich, Germany. Full particulars of this competition for readers of "The A.P." will be found in our advertisement pages.

The sixth annual volume of "Modern Photography," published by The Studio, Ltd., 44, Leicester Square, London, W.C.2, is now on sale at 5s. paper wrappers, and 7s. 6d. in cloth. There are over one hundred reproductions of photographs, including six in natural colours. There is a good variety of subject matter, and, in keeping with its title, all the pictures are in the modern spirit and style.

The attention of our readers is again drawn to the Isle of Man Photographic Competition in which £250 are offered in prizes for photographs taken in the Island, either by visitors or those who are living there. There is a First Prize of £50, four of £20, four of £10, four of £5, twenty of £1, and also a number of special prizes. The entries close on Saturday, October 3rd, and those who have either visited this holiday island, or propose doing so, should bear the competition in mind. Entry forms and full particulars are available from the Secretary, the Isle of Man Publicity Board, Douglas, I.O.M.

Ciné enthusiasts will be interested in the new "Magazine" Ciné-Kodak, which has just been placed on the market. The camera takes 16-mm. film in a special magazine, which is slipped into the camera ready for immediate use without any threading or sprocket engaging. Another feature of this camera is the facility of changing from one film magazine to another in daylight, without wasting a single frame of film. There is also a footage indicator on each magazine, quite separate from that on the camera body, to keep a record of the amount of film used. Three speeds are available, the normal 16, 8 and 64 frames a second, which cover the usual requirements. It is adapted for interchangeable lenses for which there are five different focal lengths and apertures. The view-finder is also adapted for any of these lenses without any additional frames being required. The front element of the view-finder is adjusted along its track to give the correct field of view for the lens in use. Another interesting feature is the pulsating button for timing the various shots. The button pulsates once every second, so that any length of time for a shot can be calculated by counting the number of seconds while pressing it with the finger while exposing. Other features of this camera are the built-in exposure guide, a winding crank that folds back out of the way when not in use, and a self-filming device, which allows for self-portraiture. Magazines are supplied loaded with all three types of 16-mm. Ciné-Kodak film, Pan., Supersensitive Pan., and Kodachrome colour film. The price, including leather carrying-case and focussing f/1.9 anastigmat lens, is £40. Further details are available in a new illustrated brochure, which will be sent post free to readers on application to Kodak, Ltd., Kingsway, London, W.C.

Full particulars of the new Voigtlander Range-finder "Bessa" Camera are given in a well-illustrated booklet, published by Messrs. Schering, Limited, 188/192, High Holborn, London, W.C.1. This camera, which is fitted with a focussing range-finder of the split-horizontal type, has also many other features, such as an ever-ready light filter holder, which is hinged on to the lens mount, and which will accommodate any desired colour filter, a negative mask to give double the number of normal exposures, a shutter release fitted to the back of the camera, and an automatic depth-of-field scale. This camera is fitted with any of the following anastigmat lenses, all of f/3.5 aperture, Helomar, £16 10s.; Skopar, £18 15s.; Heliar, £21 10s. The Rapid Compur shutter is standard. The descriptive booklet will be sent post free on application to the above address.

Will Mr. W. T. Proctor, of Lytham St. Annes, kindly send his full address to Messrs. Johnson & Sons, Hendon Way, Hendon, London, N.W.4.

Following closely on the death of Sir Henry Wellcome, the chief of the firm of Burroughs Wellcome, comes the news of the death of Dr. Jowett, the works manager of the English branch at Dartford. He was involved in a motor car accident on August 10th, on his way to business, and received injuries which proved fatal. Dr. Jowett was with his firm for forty years, and was responsible for many of the firm's developments in the photographic side as well as with chemistry in general.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, August 26th.

Rochdale P.S. Holiday Experiences.
Stockport P.S. Competition. Prizes by H. Ward.

Thursday, August 27th.

Camberwell C.C. Monthly Competition.
Hammersmith Hampshire House P.S. "Indoor Portraiture with Artificial Aids." S. Schofield.
N. Middlesex P.S. Lantern Lecturette Evening. Members
Oldham P.S. Open Night.

Friday, August 28th.

Sheffield P.S. (Portrait Group). 246, West St. Mr. Holmes.
Wimbledon Ciné C. Films by Stockport and D.C.C.

Saturday, August 29th.

Beckenham P.S. Boxhill, F. Garbutt.
Bolton C.C. Rivington Gardens. J. E. Balshaw.
Bristol P.S. Downside.
Hull P.S. Little Weighton and Walkington. G. Fletcher.
Ipswich and D.P.S. Helmingham Hall. G. Bird.
Luton and D.C.C. Wheathampstead.
Nottingham and Notts P.S. Hardwick Hall. W. R. Anderson.

Saturday, August 29th (*contd.*).

Sheffield P.S. Bolton Abbey. H. Hill.
St. Helens C.C. Daresbury.
Stockport P.S. Pownall Hall, Wilmslow. P. S. Wilkinson.
Walthamstow and D.P.S. First day of Annual Exhibition.
Wolverton P.S. Braunston and Daventry. H. Culvor.
Wood Green P.S. Outing.

Sunday, August 30th.

Borough Polytechnic P.S. Reigate Park and Heath. A. H. Redman.
British Photographic Fellowship. Berkhamsted.
N. Middlesex P.S. The President's Outing.

Tuesday, September 1st.

Hackney P.S. "Glazing Prints." T. Y. Unwin.
Leicester and Leicestershire P.S. Meeting at the Turkey Café.

The new

WESTON METER

LOWER LIGHT VALUES.—With its greatly increased sensitivity, the new Weston Meter ensures absolutely accurate exposure for almost every shot—indoors or out—artificial light or poor daylight—colour or black-and-white.

SIMPLER TO USE.—Readings are obtained by simply pointing your meter to the subject to be photographed.

SLIMMER and more pocketable—little bigger than a box of Swan Vestas, it can be kept in the pocket—handy.

The Leica Meter is designed for simplicity especially for the Leica.

The Universal Meter for Still and Ciné Cameras is simple for the novice and is yet designed to cover the most comprehensive needs of the experienced.

Weston was the first photo-electric cell meter introduced—and in this new meter is embodied over five years' manufacturing experience—the result is a degree of quality and permanence not possible with meters having less knowledge and experience behind them.

2 MODELS

Leica Meter especially for Leica Cameras.

Universal for all Still and Ciné Cameras.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXLVIII.

From information communicated to our Special Representative.

Mr. H. F. ANDREW.

"I THINK an essential in making a picture is the experience of commendatory feeling towards the subject. I suppose the commonest feeling is that the subject has beauty, but it may lack this and have, say, dramatic quality. An artist's business is the apt communication of feeling, and those photographers who emulate the artist have a like communication to make within the limitations of their material and skill. A study of modern photographs shows very clearly how, in skilled hands, the most unpromising material can be utilised to convey an impression of an interesting effect or mood.

"Having discovered a subject (usually an open-air one) that makes an impression on me I seek a spot where my camera can get at it adequately, and render it as a harmonious and decorous unity. I sometimes remember simple basic forms of composition, and if the main lines or masses of the subject conform in some respects the production of a picture is less chancy. I try to avoid light foreground and centrifugal lines of interest, but I like to get a foreground framing, and a principal object which usually I faithfully place well off centre. If the subject seems to demand it, however, I ignore the 'thirds' rule, as old and modern painters have done on occasion quite successfully. I then lie in wait for favourable lighting.

"Here again we may note that the practised worker may more or less ignore the usual 'rules' of composition and treatment, provided he has sufficient knowledge and imagination to do so safely.

FURNACE PLUMAGE. *H. F. Andrew.*

"I generally use a $3\frac{1}{2} \times 2\frac{1}{2}$ Wirgin Wafer camera with Meyer f/3.5 cm. lens, and Agfa Portrait Pan. flat film. I have a 'standard' aperture of f/5.6, as this fits a mental exposure rule which gives a fair guide for a given time and month. An assessment of subject value is necessary, but this is not difficult, remembering the usual relative values. I have fitted a folding sky-shade to my lens, and a cord-cum-finger-ring release to the Compur shutter. I often use an Ilford Alpha filter, which I rate at $\times 1\frac{1}{2}$ for the Agfa film.

"I also have a $3\frac{1}{2} \times 2\frac{1}{2}$ Ensign reflex with f/4.5 Tessar, but this now does duty on a home-made enlarger, with a 60-watt pearl lamp, $4\frac{1}{2}$-in. condenser, and fine ground glass.

"I always desensitise film, and develop for about ten minutes in the light of a 15-watt green lamp. I keep metol, hydroquinone and bromide in 2 per cent solutions, and carbonate in 20 per cent solution, mixing as nearly as possible to maker's formula, or I modify as desirable.

"I keep a very detailed log of all exposures and enlargements. The variety of paper I have had most success with is Agfa Brovisa normal bromide, and I develop this too with M.Q. in the light of a 15-watt red lamp. I generally make prints on the dark side, and reduce if necessary with permanganate with or without persulphate, and sometimes with ferricyanide, all used at half or quarter normal strength in the first instance. I spot with crayon pencil, erase with a dissecting knife, and finish with a dabbing of fixative.

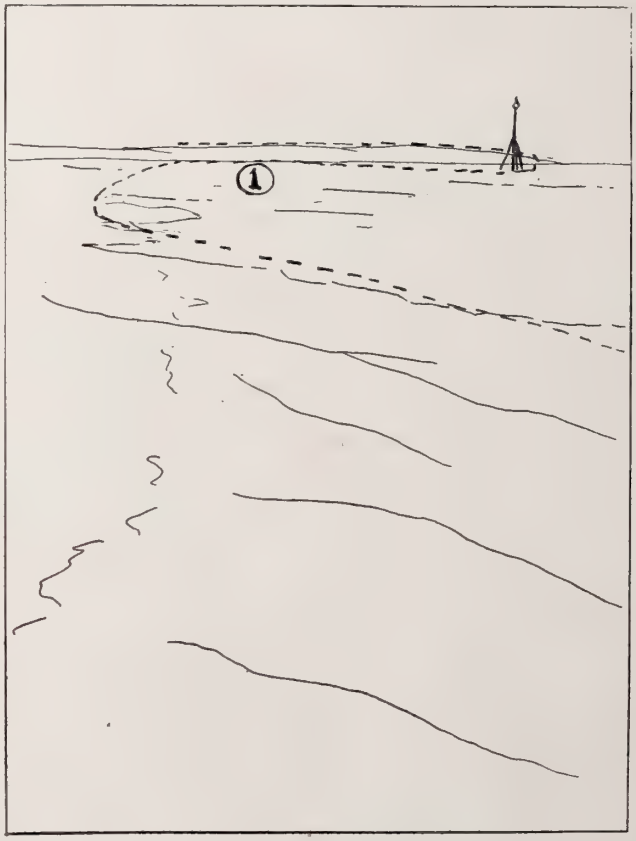
"Unfortunately I do not belong to any society, but have gained much help from a photographic friend—'The A.P.'"

(*A further example of Mr. Andrew's work is reproduced on one of the centre Art pages.*)

Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"SCINTILLATION," *by H. W. Lambert.*



MORE often than not it is the simple things that prove the most successful in the making of pictures by means of photography. A land or seascape in the grand manner, for instance, takes a considerable amount of handling before it becomes really attractive, and the quality of impressiveness, which it must retain, is decidedly not easy to achieve, but the bits of things that are seen by the way, the small and simple kind of subject, or the foreground study, seem to lend themselves most admirably to treatment by the camera.

The subject of our discussion this week is of the last-mentioned class. It is a foreground study purely and simply. It does not attempt to deal with a wide stretch of sea or sea and shore, but contents itself only with a circumscribed bit of beach, a line of surf, and an effect of sunshine seen against the light, with the addition of the beacon and distant cliff as notes of accentuation.

What form there is in the arrangement—and it does not amount to a great deal—rests with the repetitive lines of the edges of the waves as they curl upon the sand; a return along the line of light to the farthermost point of the cliff; and a reversal of direction along its topmost outline, the combination suggesting a flattened variation of the "S" curve—*vide* the dotted lines of the sketch. These encircle both the pathway of light at its brightest point, which occurs in the neighbourhood of (1), and the beacon, as a supporting accent, as well, the point (1) in question forming the centre of interest.

This point has also strength of position, it being somewhat off the vertical centre and nowhere near the edge, and, in a scheme which consists mainly of shades of half-tone, attracts the major share of the attention chiefly on account of its brilliance, but also on account of its force of placing. That it also occurs on the line of the "S" curve is again of some moment, and, with so powerful an attraction, the unity of the picture is achieved.

But, while the brightest point localises the attention, its extension through the length of the picture stresses its appeal and aids the feeling of unity, the connection established between top and bottom being responsible.

The feeling is heightened, to no little extent, by the repeated lines of the surf below the line of the curve. These are imitative in formation, and the repetition suggests an accentuation or emphasis that is not only valuable in itself, but has the effect of imparting a high sense of order upon the arrangement, as well as lending an impression of a pattern of decorative character. It is this suggestion of pattern that warrants and justifies the long length of foreground. From it, too, arises a certain impression that has elements of modernity about it, although, in these days, the downward-looking viewpoint has more or less lost its initial sense of freshness. Still, it is so well done that some of the freshness persists, and, in any case, the effect of the pathway of light is appreciably enhanced by the method of its presentation.

It gains, in no small measure, also from the fact that all but the essentials have been excluded. It is more usual to find, in a sunset subject, that both sky and sea are included in more equal proportions, and that the source of light, more often than not hidden behind a cloud, is incorporated as well. Besides being commonplace and hackneyed, such a presentation generally suffers from a division of interest, both sea and sky claiming almost an equivalent share of the attention.

Here, however, the exclusion of all but a modicum of sky and the absence of any competitive light above, throws the whole attraction upon the reflected line of light and no suggestion of a division of interest can arise.

Nevertheless, the feeling of evening quietude and peace remains, and, in fact, might be said to be enhanced by the departure from the normal method of presentation. It is a highly attractive rendering and a most successful picture.

It is just possible that a slightly greater measure of concentration might have been attained had it been found possible to bring the dark note of the beacon into closer proximity with the light at (1), but it may have been impossible to get it without the loss of some of the valuable curves of the surf, and the suavity of the "S" curve would also have disappeared. It is, moreover, extremely likely that, to bring the two points into conjunction, it would be necessary to enter the water, and it may have been that neither the necessary equipment nor the inclination existed!

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

ONE of the chief difficulties, as far as indoor portraiture or genre work is concerned, is the arrangement of the lighting. Too often—possibly on account of fear of under-exposure—the sitter is placed almost right against the source of light, and, while the result may show part of the features with a sufficiency of illumination, the remainder is characterised by a heaviness of tone that is the reverse of pleasing.

Subject and Lighting.

Alternatively, if the shadow side is adequately modulated, the section of the features in light is displayed with an entire lack of tone which is no more satisfactory. Such is a most undesirable state of affairs, but it can be corrected by removing the subject farther from the source of light and by the introduction, where found necessary, of something in the nature of a reflector.

Cases in point are Nos. 1 and 2 of the prints reproduced on the opposite page—"Mother's Help," by B. Whittaker, and "Music Hath Charms," by H. R. Griffiths. In the first, the profile is quite well shown, but the back of the head is represented by a toneless black. Placing the figure more away from the window and providing a reflector to throw a little illumination on the back of the head and body would offer a much better rendering, though, of course, it would mean that the exposure would have to be increased to correspond with the reduction of the quantity of light reaching the subject.

It is doubtful if the present exposure was more than barely enough, if that, and if the figure were moved, say, eight or nine feet from the window, the exposure given would have to be multiplied by four or five to make up for the loss of light.

Shadow Rendering.

But, assuming the sitter could be relied upon to maintain her pose without movement, the quality of the representation would be vastly improved, and, instead of the present suggestion of excessive contrast, the modulations would be full and rich and in a more harmonious relationship with one another. Not only would the lights show the needful distinctions of tone, but the darks, too, would be rendered with all the gradation they should exhibit, and the whole thing would seem more finished and adequately handled.

Much the same applies, again, to No. 2. Here, however, the lights are, if anything, more deficient still in tonal differentiation, and the shadows are no better. Moreover, there is a certain measure of halation, caused by a spreading of light within the sensitive emulsion, which stresses the defective representation of the lighter portions to a not inconsiderable extent.

The need for a greater distance between source of light and model is even more emphatic than in the previous instance, and it is a pity, for, in both cases, the subjects, in their class, are well chosen, and the care expended in their production has been rendered fruitless.

In and Out of Doors.

A better example of indoor work is to be seen in No. 5, "Joan," by G. H. Miller, where the features are shown with all their softness of modelling plainly to be seen. The pose, too, is free and unconventional, and, while the setting seems a bit on the heavy side and there might be a greater sense of direction in the lighting, the softer rendering that comes with a sufficiently distant light source is fully in evidence.

In No. 8, "Not Really," by W. E. Wild, some of the disabilities of the proximity of the light are counteracted by that reflected from the white bedclothes. Nevertheless, it is not enough to prevent the shadow under the head from appearing too dark, and a very considerable advantage would be obtained by moving the light farther away.

No. 6, "An Old Man," by Gan Koen Heng, shows to better effect, and the lighting seems quite well managed. It is, however, scarcely possible to say whether it is an indoor or outdoor subject, but, with No. 3, "I wonder where that came from?" by J. Biddulph, the nature of the subject indicates its origin beyond doubt. The sunlight is evident, and, though its effect is greater on the legs than on the features, it is a minor defect, while, on the whole, the picture is as attractive as any on the page. The workmanship, too, is technically sound, and a happy medium seems to be struck as far as the modulations of the features are concerned.

Seaside Groups.

A well-arranged group, also at the seaside, is to be seen in No. 4, "What is it?" by Arthur Mead, in spite of the fact that the head of the third figure in the rear is unsupported by any visible body.

Its general tone, however, is light and somewhat lacking in vigour. It could do with an equivalent range of tones to that of No. 3, and it is quite likely that such could be obtained by the substitution of a more vigorous grade of printing paper. At the same time, it must be admitted that, as far as the poses allow, the faces are fully modulated within their restricted range, a fact that, having regard also to No. 3, would appear to indicate that the more diffused lighting of out of doors lends itself more readily to the production of well-graded figure studies than indoors.

It is not that indoor work is not practicable, but, to get an equal effect, special precautions, such as have been outlined, have to be taken, and a good deal of contrivance is necessary.

Control and Management.

The lighting has to be brought under control or the figure adjusted to it. In No. 9, "A Bath (K)night," by B. S. Chaloner, the attempt is quite successful, for, the figure being sufficiently far from the source of light, the modelling of the features is soft and does not incline towards the excessive contrast of Nos. 1 and 2.

On the other hand, the contrasts of No. 7, "Busy Mischief," by D. G. Peacock, are much too violent, although it is an outdoor subject and conditions were decidedly more favourable. The fault, in this instance, arises from the fact that development of the negative has been carried too far for the contrast range of the paper on which it has been printed. Now that the negative is made, the only practical remedy is the choice of a softer type or grade of printing paper, an expedient that should produce a softer and more harmonious print.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

"DOPING" A PRINT.

IN the earlier days of bromide papers it was more evident than it is now that a print looked very much better when wet than it did after it had dried. On some of the papers then used the prints were pretty dreadful either wet or dry, but on other papers the prints were strong and (to use a blessed word) "rich" as they came from the washing tank, and dull, flat and lifeless a few hours later.

Strenuous efforts were made to preserve the "wet" appearance, and to this end all sorts of things were applied with brushes and flannels—wax in turpentine, megilp, and any kind of varnish that the paper would stand. The result was generally a streaky, treacly mess, and for weeks a fly would settle on the surface at its peril.

We may still "dope" the surface of a print to its distinct advantage, and beginners constantly ask for formulæ for the purpose, however frequently they are published. I intend saying something on the subject now, but it must be remembered that I have almost exclusively in view a paper that has a matt surface, or something closely approaching it, the limit being a satin or semi-matt paper. There is no purpose in doping a glossy print.

Before a print is doped a preliminary treatment is essential, and that is "spotting." Here again I am limiting myself to working with water-colour, as any form of black-lead is useless if dope is applied afterwards, and not very satisfactory if it is applied first.

In water and oil colours three different blacks are used—ivory black, lamp black and blue black. The first tends to a brownish colour, and I find that for amidol-developed prints lamp black is the most satisfactory. It is just as well, though, to have all three available. Half pans or

Fig. 1.

Fig. 2.

tubes are very cheap. Then we might have three good quality sable brushes, Nos. 0, 1 and 2. If only one is bought No. 1 is a safe choice. Lastly, we want a china palette. A good pattern is that with four small divisions, and a larger flat one in the middle.

With some water and a larger brush a small quantity of black, as dense as possible, is put in one of the divisions. It does not matter that it dries when not in use. In the second division may be put a different black, and in the other two the same blacks with a little gum water stirred in if glossy prints are to be spotted.

We first deal with any white or light spots on the dry print, and what we have to do is to make them so nearly match their surroundings that they are no longer noticeable. Moistening the brush we take a little of the dense black, and spread it on the flat part of the palette, adding water till the grey tone is right for the particular spot we are going to attack.

The attack does not consist in dabbing on a blob of wet paint. There should be no blob in the brush, which should be nearly dry and drawn to an exceedingly fine point. With this point we give delicate touches to the spot, two or three or a dozen or more, each touch leaving a dot so tiny that its effect is invisible, until we find that the spot has vanished. If there is any error in the matching of the tint it is best to err on the light side in the light areas, and on the dark side in deep shadows.

Black spots should not appear in the print if the negative was properly spotted, but if they do they can be removed with patience and acquired skill with a retouching lancet. A good shape has a point like the letter V, but with slightly curved edges. It must be exceedingly sharp, and a spot may require as many finicky touches as go to the filling of a white spot with a brush.

When not a single spot or scratch of any kind can be found on the print we can dope it with a clear conscience. The larger spots and patches of retouching are unpleasantly visible on some surfaces if we look at them at an angle, but they will vanish with the doping.

I still use for this a very old formula :

Mastic varnish	1 part
Linseed oil	1 part
Turpentine	2 parts

These should be bought from an artist's colourman, and not at the oilshop, The mixture is not used by the gallon.

The bottle of mastic may be the smallest obtainable ; the linseed oil will be rather larger, and the turpentine should be considerably more, as we may want some for another purpose later. Measure the varnish in a graduate and pour into a bottle ; measure the same quantity of oil, and pour that in ; measure twice the quantity of turpentine, and add that. Always shake up well before use.

Pour a little of the dope on to the middle of the print, and rub it quickly and vigorously into the whole surface with a plug of cotton-wool. If you have guessed the amount fairly well there should soon be none visible, but at any rate secure this condition with clean wool. If you like to see a varnishy appearance on the surface, use less turpentine, more dope, and do not clean off so thoroughly. My own idea is to make the print look " rich " without any sign of what has been done.

The print is now in condition to be treated with pigment, but with that I am not dealing now. One of the illustrations was so treated very roughly, and is the same subject I showed long ago faked with blacklead. Pigment is better, and I will deal with that soon. In the originals there is a vast difference between Fig. 1 and Fig. 2, although the work was done hurriedly. W. L. F. W.

A Prize Competition for Novices

THIS competition is specially for those readers of " The A.P." who are Novices ; that is to say, amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups, or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

Our readers who are Novices still have time in which to make their prints for this competition, and the prizes are worth having.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows :—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.
The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.
The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.
Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 30th.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows : The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked " Novices " Competition.

CAN THE CAMERA LIE ?—A New Competition

IN the Summer Number of *The Amateur Photographer*, published on July 22nd, a new competition was announced in connection with articles that appeared in that issue dealing with " pictorial inexactitudes." It was demonstrated that by judicious application of the camera, combined with unusual viewpoints, or by double exposures, results were obtained that on their face value appeared to be unreliable.

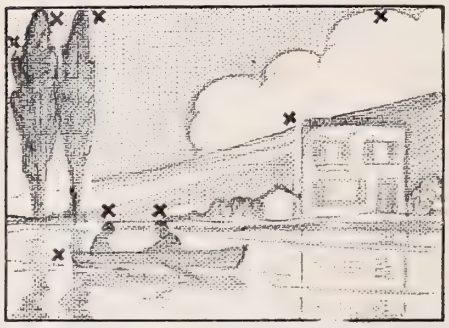
In this competition, prizes are offered for the best photographic " untruth," but the prints must be quite straight and from untouched negatives. Combination prints, or prints that have been built up by cutting out other photographs and copying, or prints that have been obtained by various " control " methods, are not eligible for this competition.

The prizes are **5 guineas, 3 guineas, 2 guineas, 1 guinea** and **10s. 6d.** They will be awarded for what are considered to be the best efforts in making the camera " untruthful." The negatives of the winning prints and of any others must be submitted for inspection if required. Technical data should also be given regarding the production of the photographs.

There are no other conditions beyond those mentioned above. A special competition coupon, which appears each week in the advertisement pages, must be affixed to the back of each print. The closing date will be September 30th.

Entries should be addressed to the Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and should be marked on the envelope, " Special Competition."

Picture Points



No. 14 (New Series) *by RICARDO*

Watch for "Joins."

PERHAPS it is only a small detail in itself, but if it is ignored in pictorial work it can mar any good picture, particularly if it occurs frequently in a single print. The point referred to is the way any form, whether light or dark, or object or shadow, is allowed to just join another.

If we examine the first sketch, we can see that at several places, each marked with a cross, there is a join between two forms that is just a little too exact to be pleasing.

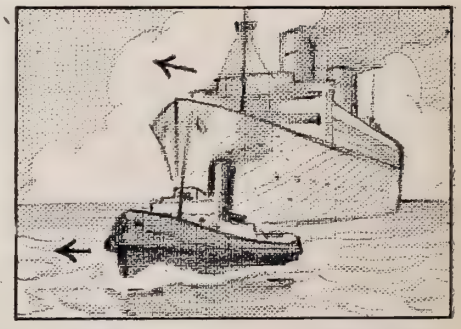
The second sketch shows how this fault can be remedied. The points in question are now missing by either carrying the forms well over each other or by leaving a substantial gap between them. In this instance, the second view could very well have been made by lowering the point of view.

When the various joins are in strong tone contrast, then, of course, the point of contact is more noticeable. Particularly is this the case when it occurs on the edge of the print, where it tends to attract the eye away out of the picture. Usually, a deeper trim will remedy the fault, but where it occurs inside the picture it calls for retouching on the print.

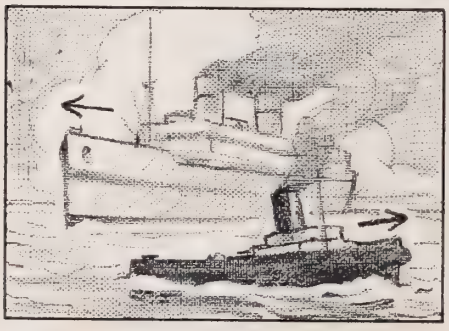
Tone Contrast.

IT is not very difficult to choose the more pleasing of these two flower studies. The top sketch shows a very stiff, formal grouping that is not exactly in keeping with the character of the objects, the flowers, and shows a certain lack of sympathy with the subject.

But perhaps the most glaring fault is the way the white blossoms are placed against a very dark ground, as many photographers do in order to contrast the tone values. It may be that the top part was a pleasing dark green or a deep yellow to which the plate was not sensitive, but as we only judge prints on their face value, it is a bad fault to have such violent tone contrast. Incidentally, having a dark background makes it harder, technically, to render the delicate subtle tones in such light flowers.



We will assume that the tone of the background was changed in the lower half because the stalks would then have been lost against the dark tone and so left the blossoms without any connection with the base of the picture. This would have been true, but with the arrangement as it now stands, the stalks are still much too weak, in a pictorial sense, to balance or "support" the heavy tone at the top.



Compare this arrangement with the lower sketch and notice how the extra tone support at the base, with the background as well as the grouping of the leaves and the lighter tone contrast throughout, gives a much more pleasing rendering. Notice, too, how the picture space is filled to better advantage.

Counter Attraction in Direction.

THIS is another variation of a point that has previously been discussed in this series, only in this instance it concerns the sense of direction rather than the vanishing point in perspective.

Two ships have been chosen to illustrate this point, as they are very strong in the way of "direction pointing," but almost every object has its particular "direction." They need not necessarily suggest movement, as with ships, locomotives, cars, figures and animals, etc., in motion, but inanimate objects, like streets and string, tables and teapots, all possess it in a varying degree, according to their "lines."

In the left-hand sketch the ships are shown moving in opposite directions, and they have been purposely drawn to have approximately equal attraction value, the larger ship being lighter and farther away to compensate for the nearer boat which, although it is smaller, is considerably darker in tone. There is an immediate confliction between the direction of each and, consequently, the eye tends to reciprocate between the two.

A much better arrangement is that shown in the right-hand sketch, where both boats are going in the same direction. There is now no divided interest and, consequently, the picture has more unity and a much stronger appeal. Notice, too, the value of repetition in the shapes of the two ships, also the pleasing tone contrast between them. It also illustrates the effectivenesss of leaving plenty of space in front of them and so preventing them from running out of the picture.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

How to use a Tripod

By "ACTINOGRAPHIST."

MOST amateur cinematographers take early steps to acquire an efficient tripod—not always as an essential piece of equipment, but because its use on certain occasions cannot be dispensed with. So far as the majority of their shots is concerned, however, a great many enthusiasts continue to work with the camera held only in the hands; and the procedure is manifest in the unsteady quality of their work.

So this is a call for the use of a tripod on *all* occasions. In the first place, only an efficient instrument should be selected. It should be capable of affording low viewpoints as well as high ones, should be fitted with a pan-*cum*-tilting head, and should be sufficiently heavy to counteract any tendencies towards unsteadiness which may be set up when using the head mechanism.

To this end, most of the light ciné-tripods are equipped with friction-grip pan. and tilt heads. These, however, often connote a slight loss of steadiness or smoothness in the movements referred to, hence all amateurs who have access to a car or other means of transportation must still regard the heavier (professional) tripods as the only ideal.

Manipulation.

Wherever possible, the camera should be affixed to the screw-head before "strutting," or placing the tripod in shooting position. Then the height of the telescopic legs should be adjusted to give the precise viewpoint required by the shot. For a high viewpoint, the legs should be fully extended and positioned as closely as possible together without incurring any risk of accident; for a low viewpoint, only the "shoes" of the lower legs should be left protruding—and these should be safeguarded against collapse, either by stringing the legs together or by placing large stones before the shoes themselves.

The panning and tilting devices may be used at any height of the tripod. With the friction-grip arrangement, it is especially necessary to use great care and steadiness in operating these—a great many telephoto shots having been ruined solely through lack of regard for this particular. The contrate wheel gear of the professional tripods, however, allows both these operations to be carried through without fear of excessive speed or jerkiness.

Zipp pans., or rapid movements of the camera connecting one shot with another, are carried out with the engagements of the tripod-head perfectly free. They should not be indulged in spontaneously but should be practised until the operator can make the swing from one scene to the next without hesitation or overthrow.

Cranes or "Dollies."

In order to secure tracking or following shots, the camera is frequently mounted upon a wheeled platform—called a crane or "dolly," according to whether it be large or small. Since the shots concerned are of tremendous importance to all real enthusiasts, the work of making such a platform *to accommodate both the tripod and the camera* is worthy of consideration.

The main platform may be a plain board sufficiently large to hold the camera-man and tripod with legs fully extended (some platforms measure only 2 ft. by 4 ft., though the more convenient dimensions are 3 ft. by 4 ft. 6 in.)

This should be provided with two pairs of rubber-tyred wheels and should be pushed (by an assistant) upon a concrete flat surface or upon smooth "runners" made from wood planking. Needless to remark, the platform may be pushed in either direction—and if it be mounted upon only three wheels instead of four, skilled camera-men can induce precise changes of direction also.

Tripod Care.

Despite its great importance in production work, the tripod is probably the least cared-for of all ciné equipment. This neglect is a great mistake and should be remedied without delay.

Always the accessory should be kept clean and free from dampness. This can be done with the aid of a rough duster—after which attention the legs should be treated with a light mineral oil. Friction-grip heads should not be oiled or adjusted except by a skilled worker. All surplus oil should be removed with a second duster before the tripod is stored away.

Now is the time for harvest pictures. There is plenty of good action subjects to be obtained with the reapers at work in the fields of wheat, oats and barley in all parts of the country.

The "Stop Press" of the Screen

By M. A. LOVELL-BURGESS.

I KNOW a ciné club in the south where the members have decided, for their summer competition, to make a news-reel between them. Individual members will make their own shots, which will be projected at the club, "pool" and incorporate the most interesting, and thus have a topical film which will be a corporate effort. This film collaboration should result in many vital viewpoints.

The popularity of the news-reel shows no signs of lessening. Few people can be persuaded to leave a cinema without seeing it. They like it because it is topical, full of movement, quickly changing in mood and *tempo*, and has a quality of unexpectedness and even surprise.

The news-reel is the most suitable type of film for the ciné amateur to make. It requires no cast, and no special lighting effects, or "props." You can take your ciné camera out into the street with the delightful possibility of getting a "scoop." And to the economically-minded amateur it is a very satisfactory way of using up odd scraps of film.

It is an established custom for amateur ciné magazines to compile for its readers each month, or week, a list of events worthy of inclusion in a news-reel. These lists are helpful to many, but there are many more to whom the centuries-old Hallaton Bottle Kicking, the ancient Egg Rolling at Preston, the Gaelic Festival at Sligo, and so on, must remain unfilmed so far as they are concerned.

These more or less stay-at-home ciné amateurs would like to know if local events are worthy of being made into a news-film. Well, of course they are! People and events are much the same the world over, and they prove much more interesting to the local community, many of whom were present on "the day," or think they spot Uncle George just behind the Mayor.

Wherever I go now on my journalistic wanderings I am increasingly aware of this other reporter on the scene—the amateur ciné camera. There comes to my ears the familiar whir, like an outsize in grasshoppers, and there is the shiny black camera being held aloft for a few intent seconds.

To make a good news-reel you need news-sense and something of showmanship. This can be developed by training yourself to pick out the essentials of a scene, unaccompanied by a ciné camera. Get into the habit at various events of asking yourself, "Now what is the significant detail, the focal interest, of this particular moment?" You will soon find your mind automatically applying itself to this problem of correct camera concentration.

Most ciné workers have had previous experience with hand cameras, and, to a certain extent, the knowledge and experience they carry over from still work to ciné work is useful. But they are also apt to have ideas entirely alien to cinematography.

Only yesterday I was watching a man film the opening of a new hall. There were plenty of minor incidents, full of action, but he concentrated on the woman speaker—she was an Honourable—who made a very witty speech. But as the lady stood perfectly still, talked without gestures, and wore a softly coloured floral dress which would, of course, photograph black-and-white, I wondered what would be the effect in the film.

The main thing is to aim at movement. Point your ciné camera at action and it will do the rest. The only time when lack of movement is bearable is when you are using a colour film and can rely upon a flare of colour to provide contrast. An excellent opportunity for using colour film is provided by a flower show, and this is the flower show season. Even then it is better to have people strolling past the massed begonias, or to film the military bandsmen in their colourful coats when they are actually playing.

Action allied to beautiful composition is the ideal which you should bear in mind, but, in the meantime, if you have to choose between action or composition, choose action every time, and keep an eye on composition also.

ACTION SUBJECTS for the AMATEUR CINEMATOGRAPHER

The Amateur Photographer and Cinematographer's Diary of Forthcoming Events

FORTHCOMING EVENTS DURING SEPTEMBER, 1936.

DATE.	EVENT.	PLACE.
Sept. 1.	Partridge Shooting commences.	
,, 1–5.	Carnival	Ryde, Isle of Wight.
,, 2.	Horse Show	Bath.
,, 2–3.	Racing	Brighton.
,, 2–11.	Cricket Festival	Scarborough.
,, 3.	Cheshire Agricultural Society's Show	Chester.
,, 4.	Beaufort Polo Club Gymkhana	Norton.
,, 5.	Royal Automobile Club's Tourist Trophy Race	Belfast.
,, 5.	Championship Dog Show	Harrogate.
,, 5.	London–Brighton Walk.	
,, 5.	Horticultural Shows	Dalkeith, Milnathort, Glasgow and Condorrat.
,, 5.	Highland Games	Pitlochry.
,, 5.	Open Golf Tournament	Kinross.
,, 5.	Horticultural Show	Jedburgh.
,, 6.	All-Ireland Hurling Final	Dublin.
,, 7.	Racing	Folkestone.
,, 7.	Golf	St. Andrews.
,, 7–12.	Championship of Highlands Lawn Tennis Tournament	Pitlochry.
,, 7.	South of England Tennis Tournament	Eastbourne
,, 7–8.	Ancient Custom—St. Giles' Fair	Oxford.
,, 7–11.	Irish Amateur Golf Championship	Portmarnock.
,, 7–12.	Croquet Open Tournament	Bournemouth.
,, 8.	Ancient Custom—Widecombe Fair	South Devon.
,, 8 & 10.	Manx Grand Prix Motor Cycle Road Race	Douglas, Isle of Man.
,, 8–11.	Racing	Doncaster.
,, 9.	Highland Games	Aboyne.
,, 9–10.	Argyllshire Gathering	Oban.
,, 12.	Racing	Ripon.
,, 12.	Motor Cycle Racing	Shelsey Walsh.
,, 12.	Motor Speed Trials	Brighton.
Sept. 12.–Oct. 19.	Festival of Light	Blackpool.
,, 14.	Croquet	Roehampton.
,, 14.	Lochaber Meeting	Fort William.
,, 15.	Golf	St. Andrews.
,, 16–18.	Racing	Ayr.
,, 16	Dog Show	Perth.
,, 17–18.	Highland Gathering	Inverness.
,, 19.	500 miles Motor Race	Brooklands.
,, 19–20.	Dr. Johnson's Birthday Celebrations	Lichfield.
,, 19–26.	Open Golf Tournament	Torquay.
,, 21.	Ancient Customs—St. Matthew's Day Fairs, Woodbury Hill (Dorset) and Bridgwater (Somerset).	
,, 21–22.	Racing	Edinburgh.
,, 21–23.	International Sheep-dog Trials	Ayr.
,, 22.	Ploughing, Thatching and Hurdle-making Competitions	Banbury.
,, 23–24.	Hunt Races	Perth.
,, 23.	Sheep-dog Trials	Newton-Stewart.
,, 24.	Croquet	Eastbourne.
,, 24–26.	Onion Fair	Birmingham.
,, 26.	Motor Racing	Dublin.
,, 26–28.	Flat Racing	Hamilton.
,, 27.	All-Ireland Gaelic Football Final	Dublin.
,, 28.	Racing	Brighton.
,, 28–Oct. 2.	English Women's Golf Championships	Hayling Island.
,, 29.	Pleasure Fair	Uxbridge.
,, 30.	Brough Hill Horse Fair	Appleby.
DURING THE MONTH.	Polo	Cheltenham.
	Lawn Tennis Tournament	Brighton.
	Cricket Festival	Folkestone.

Rolleiflex and Rolleicord

THE PRIZE WINNERS!

Reproduced by courtesy of the "Daily Herald."

£2,500 FIRST PRIZE
"DAILY HERALD" COMPETITION 1935

Photographic Competitions are now rife. There is still time to go in and win—if you have the right camera! The right camera is obviously a Rolleiflex or a Rolleicord. Last year the Rolleiflex carried off one of the biggest prizes ever offered to amateur photographers, £2,500 given by the *Daily Herald*. The prize-winning picture, taken by Mr. R. Jenkins, is shown on the left. The picture above it won a first prize in the Rolleiflex/Rolleicord European Competition. The picture below recently won £100 first prize in an open competition for Britain's Bonniest Toddler, organised by the Journal "PARENTS." Both the Rolleiflex and Rolleicord have carried off numerous other first prizes in important photographic competitions. Although they cost less than many miniature cameras, they have thus proved their superiority in producing pictures judged the best by unbiased and competent judges in open competition with other cameras.

THE ROLLEIFLEX—The construction of the camera and the placing of the controls is such that complete concentration can be focussed on the subject. This unique advantage is undoubtedly one of the reasons for its success in competition photography. The subject can be seen full size, right way up and can be watched and caught at exactly the right moment. It gives 12 pictures 2¼×2¼ on 3¼×2¼ roll film for 1/-. The square format makes an instant appeal to the pictorialist for the convenience it offers in being trimmed or enlarged to any desired shape. Proxar lenses, plate back, ciné film attachment and numerous other accessories give it a versatility wide enough for the most enthusiastic and experienced photographer—yet the camera itself is complete and easily manipulated by the inexperienced amateur. The Compur shutter is speeded to 1/500th sec., T. and B., and the f/3.5 Zeiss Tessar lens is fast enough for any subject and any light. Price **£25. From your Dealer.**

"THE GOLDEN BOOK OF THE ROLLEIFLEX"

To inspire you to better photography get a copy of this beautifully produced book. It contains 127 photographic masterpieces, complete with technical data. Price **7s. 6d.**

THE ROLLEICORD is similar in construction to the Rolleiflex and possesses most of its unique features. It possesses a new type reflex hood, and a large focussing magnifier. For taking pictures at eye-level, the subject is viewed through a mirror and double magnifier combined. Both models take the same size film and number of pictures as the Rolleiflex, and all Rolleiflex accessories, except the angle mirror. The Compur shutter is speeded up to 1/300th sec., T. and B.

With f/4.5 Zeiss Triotar lens..... **£14 10 0**
With f/3.5 Zeiss Triotar lens..... **£17 10 0**

FROM YOUR DEALER.

FIRST PRIZE £100
£75 cash and goods valued £25

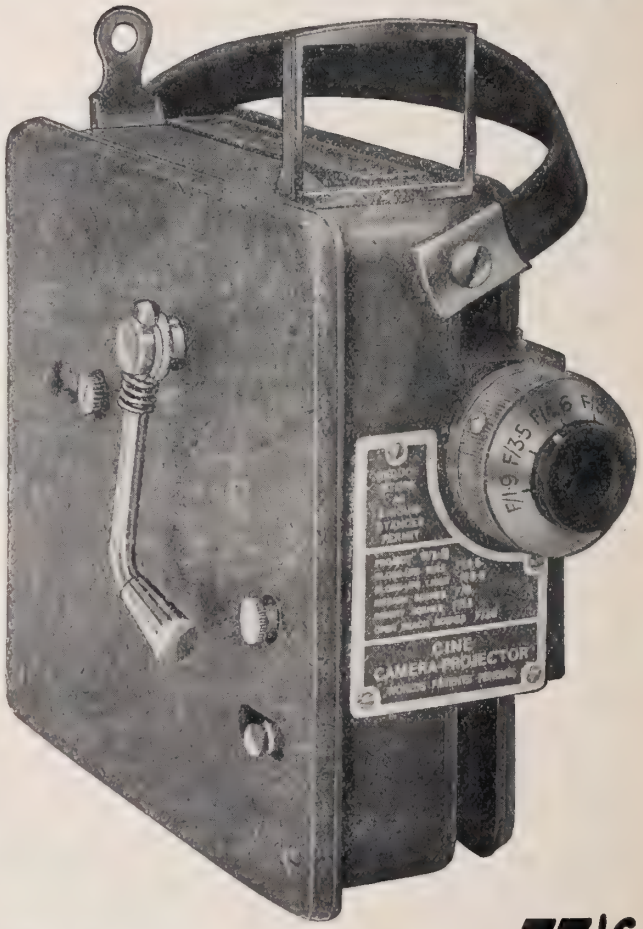
Gevaert

For
Perfect Pictures

FILTERED-ORTHO
AND
CHROMOSA PLATES



For colour values as YOU see them.

Correct monochrome rendering of the green and yellow in landscapes—without the use of a colour screen—and for recording the delicate tints and gradations of sky and cloud effects, which are inevitably lost on a plate that is not truly colour sensitive. "Chromosa" is a little more vigorous working than "Filtered-Ortho"; both are 300 H. & D. and rapid enough for all general instantaneous work. These are plates you should try—and compare.

Exhibitions and Competitions — CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, August 31. Rules in issue of July 29.

The Amateur Photographer Novices' Competition. Prizes of Roll Film for Novices' Prints. Closing date, September 30. Rules in this issue.

The Amateur Photographer Special Competition, illustrating "Can the Camera Lie?" Entries close September 30.

Wallace Heaton "35-mm. Film Competition." Cash prizes every week. Open to readers of *The Amateur Photographer* only. Full particulars in advertisement page in this issue.

XVme Salon International de Photographie de Bruxelles.—Open, May–October. (M. Maurice Broquet, Secretaire du Salon, Rue du Sceptre, 77, Brussels.)

Salon International de Fotografica de Madrid. (Señor Secretario de la Sociedad Fotografica de Madrid, Calle del Principe, 16, Madrid.)

The Folkestone Camera Club, Competition for the best photographs of Folkestone.—Entries close September 30 Cash prizes. (Ernst. F. Davidson, Hon. Secretary, Folkestone Camera Club, Town Hall, Folkestone.)

Chicago International Salon.—Open, July 23–October 4. (Alex. J. Krupy, Chicago C.C., 137, North Wabash Avenue, Chicago, Ill.)

XXXIe Salon International D'Arte Photographique de Paris.—Open, October 3–18. (M. E. Cousin, Secretaire de la Société Française de Photographique, 51, Rue de Clichy, Paris (9E).)

Radio Photo-Club de Spa. IVme Salon International de Photographie.—Open, August 9–30. (M. René Chalsèche, Avenue Marie-Thérèse, 13, Spa, Belgium.)

Forty-fifth Toronto Salon of Photography.—Open, August 28–September 12. (W. H. Hammond, Secretary, Toronto Salon of Photography, 2, Gould Street, Toronto, Canada.)

Museum and Public Library, Maidstone. Exhibition of Nature Photography.—August 15–29. (C. E. Fisher, Museum and Public Library, Maidstone.)

Tweede "Focus" Fotosalon.—Open, September 12–27. (Focus, Ltd., Fotosalon, Bloemendaal, The Netherlands.)

South African International Salon.—Open, October. (Hon. Secretary, Johannesburg P.S., P.O. Box 7024, Johannesburg, South Africa.)

Royal Photographic Society Annual Exhibition.—Open, September 12–October 10. (Secretary, R.P.S., 35, Russell Square, London, W.C.)

Buffalo C.C. Fourteenth Annual Salon of Photography.—Open, September 6–27. (H. W. Schonewolf, 528, Elmwood Avenue, Buffalo, N.Y., U.S.A.)

Morecambe, Heysham and D.P.S.—Open, September 9–16. (James F. Levisohn, B.Sc., 5, Douglas Drive, Heysham, Lancs.)

Fotoclub Zagreb, Fourth International Salon of Photography.—Open, October. (Fotoclub Zagreb, Masarykova II, Zagreb, Yugoslavia.)

London Salon of Photography.—Entries, September 2; open, September 12–October 10. (Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

Lincoln Camera Club.—Entries, September 5; open, October 15–November 12. (Miss E. Redfern, 146, Burton Road, Lincoln.)

XII Salon International de Fotografica, Zaragoza, Spain.—Entries before September 10; open, October. (Secretary, Sociedad Fotografica de Zaragoza, Plaza de Sas, 7, Zaragoza, Spain.)

Third Canadian International Salon of Photographic Art.—Entries, September 10; open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, National Gallery of Canada, Ottawa, Canada.)

Windlesham C.C.—Entries, September 10; open, September 25–26. Classes for members (Beginners, Advanced, Professional, also Open Class). (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

IV International Hungarian Exhibition.—Entries, September 15; open, October 24–November 9. (Secretary, Magyar Amatörfényképezök, Orsz. Szövetsége, Budapest VII, Erzsébet-körut, 9, Hungary.)

Rotherham P.S. Forty-seventh Annual International Exhibition.—Entries, September 21; open, October 14–17. (E. George Alderman, Ruardean, Newton Street, Rotherham.)

Service Co. (London), Ltd., Happy Camp Snaps Competition. Cash prizes.—Entries, September 30. (Service Co. (London), Ltd., 273, High Holborn, London, W.C.1.)

Coronet Midget Camera Competition. Cash prizes.—Entries, September 30. (Coronet Camera Co., 310, Summer Lane, Birmingham, 19.)

Eighth International Photographic Salon of Japan.—Entries close in Tokyo September 30; open, November (Tokyo and Osaka). (Sec., International Photographic Salon, Tokyo Asahi Shimbun, Tokyo, Japan.)

Photographic Society of America 100 Print Salon.—Entries, October 1. Limit 4 prints. Entry fee $1.00. (Dever Timmons, Salon Secretary, Box 216, Cashocton, Ohio.)

The Third Yorkshire Salon, 1936, at Mortimer Gallery, City Hall, Hull.—Entries, October 1; open, October 31–November 30. (Graham Fletcher, Netherlea, Kirk Ella, East Yorks.)

Johnson's "Holiday" Competition. Cash prizes.—Closing date, October 31. (Johnson & Sons, Ltd., Hendon, N.W.4.)

U.P. International Exhibition of Photography, 1936 (Lucknow).—Entries, November 1; open, December 5, 1936–February 4, 1937. (Dr. K. N. Mathur, D.Sc., Hon. Sec., U.P. Amateur Photographic Association, Lucknow University, Lucknow.) Entry forms obtainable also from the Editor of *The Amateur Photographer*.

Tenth International Christmas Salon of Pictorial Photography (Antwerp).—Entries, November 15; open, December 20, 1936–January 3, 1937. (J. Van Dyck, Sec., Fotographische Kring "Iris," Ballaestr. 69, Antwerp.)

Leicester and Leicestershire P.S. International Exhibition of Pictorial Photography.—Open, February 22–March 14, 1937. (H. Foscutt, 19, Doncaster Road, Leicester.)

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. They are printed in either the vertical or horizontal form as shown here, and each is complete in itself.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5×3, supplied for card index cabinets.

The collection when completed will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index, and are now ready. The size of the box is 5½×3½×3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d., post free.

28. DESENSITISERS

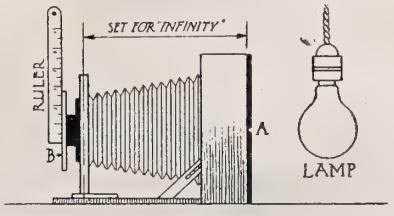
ALL plates and films, whether panchromatic, orthochromatic or ordinary, can be developed by inspection by brighter lights if they are first placed in a desensitising dye bath for a minute or two, immediately before developing and after exposure. The safelights to be used can then be either red, weak yellow, or even dim reflected white light, according to the particular desensitiser used. No extra or shorter exposure in the camera is needed for negatives that are to be desensitised. If panchromatic emulsions are used they must be placed in the desensitising bath in total darkness.

After immersion in the desensitiser (an extra minute will not matter), the plate should be rinsed before being placed in the developer.

There are three main types of desensitisers in use, Pheno-safranine, Pinacryptol Green and Pinacryptol Yellow. Of these, the Pinacryptol Green is the most popular, the Pheno-safranine tending to stain the emulsion unduly, while the Pinacryptol Yellow is used more for colour plates, as it does not stain.

For use, Pinacryptol Green should be diluted, 1 part to 5,000 parts of water, but a concentrated solution will be found more convenient for storing purposes. Dissolve 10 grains of the dye in 11 ounces of warm water (1 to 500), and for use take one part of this stock solution to nine parts of water. The diluted solution can be used repeatedly, but should be filtered occasionally.

Pinacryptol Yellow should be diluted and used as for Pinacryptol Green.



29. CALCULATING LENS APERTURES

ALL lens apertures for "still," ciné cameras and enlargers are now expressed in values of *f*, such as *f*/2, *f*/4.5, *f*/9, and *f*/32, etc.

Briefly, this means the ratio of the effective diameter of the lens aperture (or stop) to the focal length of the lens. If a lens of 6-in. focal length had an aperture which measured 1 in. in diameter, the aperture would be *f*, 1:6 or, as is more commonly expressed, *f*/6.

To measure the diameter of the aperture, it is not sufficiently accurate to measure the diameter of the front lens component, or even the diaphragm itself, but the diameter of a parallel beam of light projected through the lens by a point of light in the focal plane, when the lens is focussed for infinity.

In the place of the ground glass, or in the case of a roll-film camera on the film rollers, place a piece of card with a small hole, 1/16th in. diameter, "A," in the exact centre. Set the camera focussing for infinity. Place a piece of ground glass, "B," over the front of the lens and open shutter. Place a strong light at "A," when it will project a disc of light on the ground glass. Measure the diameter of this disc and divide it into the focal length. The quotient is the *f* number of the stop used.

"The A.P." Monthly Competitions

PRIZES AND RULES.

To encourage pictorial outlook and good technique in the photographic work of our readers in all parts of the world.

(I) For Advanced Workers.

This class is open to all amateur photographers.

FIRST PRIZE.—One guinea in cash or "A.P." silver plaque (optional).

SECOND PRIZE.—Half a guinea in cash or "A.P." bronze plaque (optional).

THIRD PRIZE.—Five shillings in cash.

A special prize of five shillings in cash for the best mounted picture.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) All prints must be accompanied by a stamped addressed envelope or wrapper if they are to be returned. Prints receiving an award will be retained.

(2) Prints must be mounted, but not framed.

(3) Returnable prints in the Advanced Section will be sent back with a typed criticism, and classified according to merit.

(4) Prints may be of any size and by any process, and must be the competitor's own work throughout.

(5) The award of a prize or certificate in the Advanced Workers' Competition or any other competition or exhibition will not debar the competitor from entering again on future occasions and winning further prizes.

(II) For Intermediate Workers.

This class is to encourage those readers who have passed the "beginner" stage and may have won an award in the Beginners' Competition, but have not progressed sufficiently to enter in the Advanced Competition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 10×8 in., and can be by contact or enlargement by any process, and may be mounted.

(2) The whole of the work (exposure, development, printing, etc.) must be carried out by the competitor.

(3) Prints entered in the Intermediate Section will be criticised and returned if accompanied by stamped addressed envelope or wrapper. Prints receiving an award will be retained.

(4) The award of a prize or certificate in the Intermediate Competition debars the competitor from entering this competition again, but he is then eligible for the Advanced Workers' Section.

(III) For Beginners.

This class is open to those who have never won an award in any photographic competition or exhibition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 6×4 in. Contact prints or small enlargements up to this size are eligible, but must be unmounted.

(2) The exposure must have been made by the competitor, but developing and printing may be the work of others.

(3) No prints can be criticised or returned.

(4) The award of a prize or certificate in the Beginners' Competition debars the competitor from entering this section again.

General Rules.

(1) Any number of prints may be entered, but each print must have on the back the appropriate coupon (see advertisement pages) the date of which must be within five weeks of the closing date of the competition. Overseas readers may use the most recent coupons to hand.

(2) Each print must have on the back the name and address of the competitor, and the title.

(3) All entries must be addressed to The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the package must be marked on the outside "Beginners," "Intermediate," or "Advanced," as the case may be.

(4) No packages will be received on which there are postage charges to be paid.

(5) No communications on other matters should be enclosed with competition prints. No correspondence in connection with the competitions can be undertaken.

(6) The entry of a print will be regarded as a declaration that it is eligible under the rules, and that the competitor agrees thereto.

(7) No responsibility is taken for the safety of prints, and the Editor's decision on all points connected with the competitions is final.

(8) The publishers of *The Amateur Photographer* shall have the right to reproduce, without payment, any print entered, or to allow its reproduction in any other paper quoting from *The Amateur Photographer*.

(9) The closing date of each competition is the last weekday of the month. Prints arriving late will be entered for the next month's competition.

(10) The cash prizes awarded in these competitions are dispatched on the fifteenth of the month following the announcement of the awards.

The closing date for the August competition is Monday, August 31st, and for the September competition, Wednesday, September 30th.

The London Salon of Photography 1936.

SENDING-IN DAY, Wednesday, September 2nd.

THE TWENTY-SEVENTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at the Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 12th September, to 10th October, 1936.

CONDITIONS OF ENTRY.

(*Please read carefully.*)

1. Pictures must not be framed; but may be mounted or unmounted. Each picture must bear on the back clearly written (a) name of artist; (b) number and title of picture, corresponding to particulars on the Entry Form.
2. When mounts are used they should conform to the following sizes—25×20, 20×16, or 15×12; but no mount to exceed 25×20; and it is suggested that white or light-toned mounts be employed. Prints may be of any shape or size, provided they do not exceed the limits of the mounts as given above.
3. All packages of exhibits from abroad must be clearly marked on the outside: "PHOTOGRAPHS FOR EXHIBITION ONLY—NO COMMERCIAL VALUE—TO BE RETURNED TO SENDER." No prices to be marked on the prints.
4. Pictures sent unmounted will be suitably mounted by the Salon Committee and all accepted pictures will be shown under glass.
5. Pictures must be sent by post or parcels post, packed flat and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.
6. All pictures for the exhibition must arrive at the above address on or before Wednesday, September 2nd. Entries may be delivered by hand at the Gallery on that date only.
7. The Entry Form for pictures from abroad must be sent SEPARATELY by post, together with entry and packing fee of 5s. (this fee covers any number of pictures from one exhibitor). Exhibitors residing in the British Isles may enclose Entry Form and fees with their pictures.
8. Pictures sent by post will be repacked in the original wrappings and returned, carriage paid, after the close of the exhibition.
9. As applications are made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify in the space provided on the Entry Form, whether they have objection to such permission being given. The copyright in all cases remains the property of the authors of the prints.
10. The Committee assure intending exhibitors that the greatest care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.

If pictures are sold a Commission of 15% is payable to the Salon.

The submission of pictures will be understood to imply acceptance of the above conditions.

Notification of acceptance of pictures will be sent out as soon as possible.

A catalogue will be sent to each exhibitor.

Entry Forms and further particulars from the Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

A MINIATURE CAMERA DANGER.

SIR,—May I trespass upon your valuable space to draw attention to an unfortunate tendency which is becoming all too frequent nowadays?

One cannot fail to admit that the modern miniature camera is a marvel of ingenuity and precision, but, because of its comparatively tiny image, there is a great temptation to work far too near to the subject, especially when dealing with "Close-ups"; portraiture, for instance, and certain genre subjects. Thus, in conjunction with the short-focus lenses normally fitted (where only one lens is available), the foreshortening effect may be quite pronounced.

I am reminded of this in your issue for July 29th, where, on page 118, you reproduce the winning print in the Wallace Heaton "Advertising Photographs" Competition. Note the enormous forearm of the thirsty subject—or is it merely one more proof of the efficacy of beer? Further, I would draw your attention to the cover picture on the issue for July 8th. Here again the same defect occurs, the leg nearest camera would make any mother look twice at her offspring!

Therefore, in the best interests of photography and the future reputations of my fellow readers, I trust these difficulties may be avoided by keeping in mind that old adage, "Forewarned is forearmed."—Yours, etc., C. H. W. K.

BRITISH LENSES AND MINIATURE CAMERAS.

SIR,—We are told that British lenses are the best in the world. It is well known that they are used extensively for Press and aerial work, but where are they when it comes to miniature cameras? In your issue of June 24th last seventy-five models of cameras were described, the aggregate number of lenses shown as alternatives being no less than one hundred and seventy-three. Out of this number, there are only eighteen choices of British-made lenses. That Britain produces the finest ciné lenses is borne out by the fact that they are almost universally used in film studios and cinemas throughout the world. If, therefore, our lenses are the best for *moving* pictures, why not for *still* pictures? British engineers should be able to produce a precision miniature camera, second to none, at a price which is competitive, considering the import duty payable on foreign instruments.

Perhaps some of your readers could enlighten me, or even the manufacturers themselves might state the cause of their apparent antipathy towards what must be a very extensive, expanding, and, one would think, remunerative market.—Yours, etc., K. E. RYALL WEBB.

NUMBERING FILMS.

SIR,—I have noticed in the issue of July 8th that a correspondent, Mr. C. E. Falkner, suggests the printing of a second set of numbers on the backing-paper of roll films.

It may interest him and others to know that about eighteen months ago I sent a special letter to one of our largest British film-makers on this subject. I pointed out that if they could print exactly midway between existing numbers a further numeral, indicated as 1A, 2A and so on, and enclose a black paper mask with the film, it would enable any camera user of the $3\frac{1}{4} \times 2\frac{1}{4}$ size to take 16-on whenever he wished.

The result was a polite letter to the effect that they did not propose to do anything in the matter, and that camera users who wished to take sixteen photographs on a film usually had a special camera with two windows.

There I let the matter rest, but no doubt one day a foreign manufacturer may adopt the idea and sell us still more films made in another country.—Yours, etc., W. R. B.

MINIATURE CAMERAS OF THE PAST.

SIR,—Your correspondent who found "a metal miniature hand camera with focussing screen and one back," taking a picture $1\frac{1}{4}$ in. square, listed in Marion's 1892 catalogue, may be interested to know that the same camera is advertised in the 1887 edition of "Marion's Practical Guide to Photography."—Yours, etc., J. S. OVERY.

LENS FOCUSSING.

SIR,—Isn't it high time that some camera manufacturers realised that to scale the lens focussing in feet instead of in yards is next to useless and extremely irritating? The yard is so much easier to visualise. An average pace is about a yard. A man's length along the ground is about two yards, easy lengths to judge and good units on which the longer distances can be based. But 4, 5, 8, 10 and 13 feet! These marks on my lens barrel give me the jitters, and it is not an easy matter to keep dividing these distances by three when a passing shot demands quick shooting. I can, of course, rescale my lengths in yards, but that is not so simple when the lens barrel is only an inch or so in diameter and is already cluttered up with those odd foot distances. Ask any Press-man and see if he judges his distances in feet. The more up-to-date focal-plane Press cameras are now engraved boldly in yards, and we might well take a leaf from their books. If focussing scales were all marked 1, 2, 4, 8, 10 yards and infinity, I feel sure that we should see less bad focussing. Should the distance of the subject come between any two of these marks, it is much easier and more certain to adjust the *distance* to suit one of the standard yard distances engraved on the scale than to try and split hairs and go between the marks and risk bad focussing. What is the practical experience of other readers?—Yours, etc., J. A. MILLER.

A USE FOR SILVER FOIL.

SIR,—I am sure that many of your readers will appreciate the following tip: If instead of throwing away the tin foil from packets of cigarettes they be collected and stuck edge to edge on a stout piece of card, they will make an excellent reflector, surpassing easily the white sheet one usually uses.—Yours, etc., A. DANIN.

"The A.P." Monthly Competitions — AWARDS FOR JULY.

As we pointed out in a recent issue, entries for all our competitions continue to increase in number, and the quality on the average remains high. This is particularly the case in the Advanced Workers' Section, where competition for the highest places is exceedingly keen. In the Beginners' Section, as is invariably the case, a good many prints, some of them of outstanding merit, were disqualified through not observing the regulations in regard to size. The awards are as follows:—

ADVANCED WORKERS' SECTION.

First Prize.—"Water Lilies," by Mrs. K. M. Parsons, 83, St. Peter's Avenue, Caversham Heights, Reading.

Second Prize.—"A Somerset Lane," by G. Warren Parrett, Corbière, Fitzmary Avenue, Margate.

Third Prize.—"Caught Red-handed," by B. R. Fiskwick, Braeside, Castle Hill, Prestbury.

Mounting Prize.—"Spring Afternoon," by H A. Postlethwaite, 23, Southmead Road, Westbury-on-Trym, Bristol.

Certificates of Merit.—"The Davit," by A. R. Elliott, Taunton, Rawcliffe, Goole; "Marine Vista," by Edward Alenius, 159-18-84 Road, Jamaica, New York; "Port Said Harbour," by Yahya Arif, De Menashe Avenue, Maadi, Cairo; "Back to Harbour," by Wm Jackson, 105, Park Grove, Hull.

The prints not receiving awards have been grouped, those in the first group receiving Honourable Mention. The others have been marked Class 1, Class 2, Class 3 respectively.

Those awarded Honourable Mention are as follows: (2) R. Sanders (Birmingham); A. Pitman (London, W.); (2) Wm. Jackson (Hull); Arthur G. Dell (London, S.E.); Ernest G. Granger (London, W.); H. Emmett (Northwich); Yahya Arif (Cairo); Geo. A. Slight (London, S.E.); J. H. Clark (London, S.E.); A. R. Turpin (London, N.W.); H. E. Haasse (London, E.C.); R. C. Jude (St. Ives); H. A. Postlethwaite (Bristol); (2) Mrs. K. M. Parsons (Reading); A. N. Row (Bombay); J. F. Cutler (Edgware, Middlesex), Emile Laevaert (Belgium); A. H. Garmston (Bristol); Wm. Robinson (Carlisle); (2) G. P. Phillips (London).

INTERMEDIATE SECTION.

First Prize.—"Eventide," by Miss B. M. Smith, 13, Market Place, Pickering Yorks.

Second Prize.—"The Summer Breeze," by C. H. Diddams, 24, Spennithorne Road, Stockton-on-Tees.

Certificates of Merit.—"Expedition," by A. G. Adley, 46, Lawns Court, Wembley Park, Middlesex; "The Red Hills, Isle of Skye," by Philip B. Law, 9, Garden Lane, Heaton, Bradford; "A Fisherman's Paradise," by C. R. Peters, Higher Chubton, Yelverton, S. Devon; "Portrait of Springer Spaniel," by Miss U. Ogle, Little Wyford, Frankland Crescent, Parkstone, Dorset.

BEGINNERS' SECTION

First Prize.—"Holiday Afloat," by W. Schofield, 30, Michael Road, Sheffield, 3.

Second Prize.—"Staff College, Quetta," by S. Cdr. L. V. Baker, I.A.O.C., The Arsenal, Quetta, India.

Certificates of Merit.—"Just a Cat," by C. M. Sinclair, 50, Ralston Avenue, Crookston, Glasgow, S.W.2; "Power," by J. E. Robson, 46, Kingsmead Road, Tulse Hill, S.W.2; "Low Tide," by Joan K. Holland, The Warren, Guildford, Surrey; "Expectation," by L. D. Franck, Box 837, Johannesburg, "Look at this Cartoon," by W. N. Connor, 266, Waterloo Road, Blackpool.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Spirit Level on Camera.

Whereabouts on the camera should a spirit level be fixed—on the baseboard or on the top of the camera body near the ground glass? How can I check the correct position for fixing it?
J. T. B. (Winchester)

If the camera has only one position for the baseboard, i.e., at 90° to the ground glass, then the level will be quite efficient if fixed on the inner or top side of the baseboard. If, however, there be several angle positions for the baseboard, e.g., as with a wide-angle drop baseboard, then, of course, it is useless to fit the spirit level there. The best remaining position is on top of the camera body, over the ground-glass focussing screen. Whichever of the two positions is chosen, do not fix the spirit level without the aid of another spirit level to check up its accuracy of position. After fixing the spirit level, position the camera so that it is level and then with the second level check up the ground glass for its corresponding position. If a two-position camera, check up as well for the second position to be perfectly sure that it is efficient both ways.

Wide-angle Lens.

Does a wide-angle lens give a smaller image than a normal lens of the same measurements? If not, how does it squeeze in more of the picture?
F. S. K. (London.)

All lenses of the same equivalent focal length (the distance between the centre of the lens and its image when focussed at infinity) give exactly the same size of image. This applies to all types of lenses, whether wide angle, normal angle, or telephoto, whether meniscus, achromatic, R.R., or anastigmat, or whether a small, medium or large stop is used. So that if we had a quarter-plate which allowed for interchangeable lenses, and we focussed on a certain object with a 4-in. wide-angle lens, a 4-in. normal lens (as is usually fitted), and a 4-in. telephoto lens (as would be used on a ciné camera) we should find that each produced an image of the object of equal size. The wide-angle variety differs in this respect, it carries the definition into the corners of the plate where it would be just as sharp and of equal density as the middle of the plate. The normal lens would cause the definition to fade away at the corners, while the telephoto lens would give an image of only a small circle in the middle of the plate, and leave the rest of the plate quite clear. But the size of the image in the centre of each would be the same.

Crystal or Anhydrous.

When chemicals are given in formulæ, are they to be understood as crystals or anhydrous?
A. B. (Luton.)

Unless it is specifically stated that they are anhydrous (anhyd.), you can always assume that the amount given is for the crystals.

Neo-Coccin for Negatives.

How is neo-coccin used on negatives? Is it permanent once applied, and can it be removed without any effect remaining on the emulsion?
A. L. R. (London.)

Neo-coccin is sold in the form of a red powder, and for use a few grains of it are added to a small quantity of water to make a pink solution. Use a very dilute solution in preference to a strong solution and apply it with a camel-hair brush on the parts of the emulsion which require holding back, or lightening, in the print. If it is a large area apply a flat wash as evenly as possible, covering each part once only. After a few minutes another wash can be applied with the brush marks at right angles to the previous wash. It is much better, although it takes longer, to give many weak washes than to attempt it with one strong application. The edges can be softened off by running round them with the brush recharged. The solution lends itself admirably to the airbrush method, but this, of course, requires more skill. The stain is quite permanent and does not weaken or strengthen with age. The stain can also be removed by prolonged washing in plain water, without leaving a mark or stain in the emulsion.

Bromoil Bleacher.

Please supply a good all-round bleacher for bromoil prints.
Q. T. B. (Salisbury.)

The following combined bleacher and acid bath is excellent and is recommended for weak and flat bromides.

Copper sulphate, 10 per cent	6 drs.
Potassium bichromate, 10 per cent	2 drs.
Potassium bromide, 10 per cent	4 drs.
Hydrochloric acid (pure) ..	2 drops
Water	9 oz.

Use at 65–70° Fahr. and print should be completely bleached in about three minutes.

Dry-mounting Bromoils.

Is it quite safe to dry-mount bromoil prints? Will the heat have any immediate or future effect on the ink?
A. C. C. (Dunstable.)

Provided that the ink is thoroughly dry, the degree of heat necessary for dry mounting should not have any effect on the colour or permanency of the ink. As to how long the ink will take to dry depends on the type and consistency of the ink used. It is possible to mix an ink that would dry in a day or two, while some take as long as three or four weeks. It is very seldom, however, that bromoils are dry mounted, as the usual method of mounting behind a thick cut-out mount not only saves a lot of trouble and possible damage, but offers some measure of protection to the surface, and incidentally, looks better.

Safelight Unsafe.

Is there any simple method of testing my ruby safelight, which I strongly suspect to be unsafe?
M. E. W. (Brighton.)

This test is both simple and efficient. Take a sample of the sensitive material you generally use in the camera and at about the distance you usually work, cover up the emulsion completely with a card. Move the card an inch or so and expose the strip of emulsion thus revealed for about thirty seconds. Repeat the process three or four times, but leave the last half an inch of the emulsion unexposed in any way. Develop fully and fix. The various strips will no doubt be fogged to a certain degree and will offer a comparison with the unexposed strip, which should be quite clear. At the same time the times taken for the lighted strip to fog will indicate the safe limit which may be taken when using negative material of the same type. In the same way, a yellow or orange safelight may be tested for use with bromide papers.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS :—

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue : 13 consecutive insertions, 5% ; 26 consecutive, 10% ; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry ; Guildhall Buildings, Navigation Street, Birmingham, 2 ; 260, Deansgate, Manchester, 3 ; 26B, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

Stop!

No need to look any further. Here are some very fine Camera bargains specially selected from our huge stock for "A.P." readers. Some are in condition unrecognizable from new—all are guaranteed in good condition.

3512.—Voigtlander Perkeo (16-on-V.P.), f/3.5 Skopar, Focar portrait lens, 5 filters, leather case..... **£7 19 6**

3459.—Foth-Derby (16-on-V.P.), f/2.5, Rhaco finder **£5 5 0**

3533.—Zeiss Baby Ikonta (16-on-V.P.), f/3.5 Novar, Compur, suede case..... **£4 19 6**

Leica Model III, f/2 Summar, Universal finder, reflecting finder, leather case. As new..... **£36 8 0**

3453.—Kodak Six-20 Duo (16-on-120), f/4.5, Pronto D.A. shutter, release **£4 15 0**

3462.—3½×2½ Ensign Roll Film, f/4.5 Lukos, Compur, leather case **£3 10 0**

3423.—Zeiss Icarette Roll Film and Plate Model, f/4.5 Tessar, Compur D.A. shutter..... **£9 15 0**

3475.—Ensign Selfix 20, f/7.7 Ensar, 3-speed shutter, leather case **£1 19 6**

3294.—3¼×2¼ Zeiss Ikonta, f/4.5 Zeiss Tessar, Compur D.A. shutter **£7 15 0**

3521.—Model I Super Ikonta (16-on-120), f/3.5 Zeiss Tessar, Compur Rapid shutter, leather case. As new **£14 10 0**

3529.—6×6 Rolleiflex (Latest Model), f/3.5 Zeiss Tessar, 2 Proxar lenses, filter, hood, iris diaphragm, ever-ready leather case. Cost £30 18s. 6d. Exactly as new **£24 0 0**

3167.—2½×1⅝ Dallmeyer Speed, f/2.9 Dallmeyer Pentac, 3 double slides, F.P. adapter, ×2 filter, leather case. Good condition **£12 12 0**

3430.—3½×2½ Balda Venus Wafer Plate Camera, f/3.5 Meyer Trioplan, Compur D.A., 3 slides. Exactly as new **£7 7 0**

3526.—3½×2½ Certotrop Plate Model, f/2.9 Schneider Xenar, Compur D.A. shutter, rising and cross front, F.P.A., leather case. In new condition..... **£12 0 0**

Approval against Deposit.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer." The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged ; over £10 and under £50, 2/6 ; over £50 and under £75, 5/- ; over £75 and under £100, 7/6 ; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed **& Co.**

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

EXAKTA Multispeed Model B, Exakta f/3.5, Dallmeyer Telephoto f/5.6, 6-in., as new, £19/10 ; Rubyette 3½×2½ Reflex, revolving back, 3 slides, F.P.A., f/4.5 Dallmeyer, as new, £9/10 ; Agfa 3¼×2¼ Self-erecting, f/8.8, 30/- ; Six-20 Kodak Junior, 27/6 ; Ensign Pocket Twenty, 15/6 ; V.P. DUNSCOMBE'S "PERSONAL" CAMERA COLUMN

'SERVICE SUPREME'

THE MEMOIRS OF

ELMAR ACOOS

continued.

Being extracts from his diary written in the Mayor's Parlour at Chortle-cum-Hardy.

●

"Whilst seated in the bath-tub, my thoughts somewhat drown my usual vocal efforts which are known to be at their best on such occasions. Yes! the Stag Party was a colossal success, but it seems almost incredible that such scenes could have ever taken place in the Town Clerk's apartment. When I showed Councillor Koshun some of the pictures taken with the Summar f/2 lens he threatened to sue the Mayor for libel, which goes to prove that the Leica never lies, and, of course, indicates the speed of this wide-open lens under conditions which could hardly be considered normal. One member of the Watch Committee asked the brand of spirit in which the celebrated film* was developed, and it is worthy of note to record that Supramin was the 'feinkorn-entwickler' used (a jolly good developer this for all miniature films, only costs 2s. 4d. a can for 36 oz.).

"The more my thoughts turn back to that memorable night, the more glad I am that television has not yet come into the home to be the curse of all men who stay out late and whose pleasures might be inspected on the spot as it were by one's wife, such a lamentable state of affairs would make life intolerable to the big shots of Chortle-cum-Hardy, and for married men the world over.

"To be able to keep a photographic record of such occasions is, however, quite a different proposition, and useful in many ways. For instance, a little mild form of blackmail would produce quite a considerable number of new Leica enthusiasts if handled in the right way, as the threat to send informal snapshots of the Watch Committee at work to their respective housewives or publish same in the Ratepayers' Bulletin would very quickly start competition of a reciprocating nature, then everybody would be more or less happy, and the great family of E. Leitz would increase by the ten score and more each day, thus causing a traffic jam between Messrs. M. W. Dunscombe's establishment and the Post Office parcels depot."

**Kodak Super X Pan. Film, loaded in your own Leica charger for only 1s. 6d. post free.*

FLIGHT
THE AIRCRAFT ENGINEER AND AIRSHIPS

The First Aero Weekly in the World

All the latest developments in connection with aviation are recorded in the pages of "Flight."

Illustrated descriptions of new aircraft, aero engines and equipment, British and Foreign, appear regularly, as well as practical articles giving the latest information for Club members and amateur pilots.

"Flight" is the leading authority on aviation. It contains Royal Air Force news, and deals with the work of R.A.F. Squadrons, with Private Flying, and with Commercial Aviation, Airlines, and Airports.

A special staff of highly competent aerial photographers ensures that "Flight" contains the finest photographs of aviation in all its aspects.

EVERY THURSDAY 6d.

From all Newsagents and Bookstalls.

As advertisements on these covers go to press a fortnight in advance some of these second-hand items may be sold already, but similar outfits are usually available.

A NEW SPECIAL SERVICE

Do you want "Grainless" developing by our "Microlux" Service?

In order to meet an ever growing demand for superlative results from Miniature film negatives we have now equipped a laboratory expressly for the **hand** development of films, using special individual developing tanks in which developing, fixing and washing are done without the film being subjected to handling or any other risks. Our "MICROLUX" Service of developing in Paraphenylene Diamine and other similar agents ensures the finest possible results from your film; results which have so minute a grain size that they will enlarge twenty diameters or more with out the grain becoming apparent, but owing to the nature of this development it is **essential** that films for "MICROLUX" development receive at least **twice the normal exposure.**

Providing this extra exposure is given negatives developed by our "MICROLUX" process possess a quality that cannot be equalled by more ordinary methods, but to submit a film which has received merely the bare minimum exposure to this form of development will not yield satisfactory results. Such "minimum exposure" films we can also develop under the same "INDIVIDUAL" conditions, but in this case the results are not of such microscopic grain size. Naturally this "special" work is considerably more expensive than our normal service, but the results are so immeasurably superior to those that can be secured even under the best regulated "Factory" conditions, that we offer this service, confident in the belief that it will meet the requirements of those careful workers who would always do their own processing had they the convenience.

"MICROLUX" AND "INDIVIDUAL" Development Prices.

Leica, Contax and similar films: Per 36 exposures, **4s. 6d.**; per 12 or 18 exposures, **3s. 6d.**

All other 6, 8, 12 or 16 exposure films (up to 3¼ × 2¼ size): Per film, **3s. 6d.**

Note.—As mentioned above, twice or three times normal exposure **must** be given for "MICROLUX" developing, or if this has not been done "INDIVIDUAL" processing should be specified. When sending films for this special treatment it is more than usually necessary to advise us as to the make and type of film used.

Improving the Shining Hour

Whatever the time of day, early morning, afternoon or late evening—as long as there's daylight left—the extra speed of Selochrome Roll Film makes photography not only possible but successful.

Selochrome Roll Film multi-coated and anti-halo backed, is very generous in latitude, and, to add to the perfection of your pictures, renders greens and yellows at their true tone values.

Colour photography made easy by

'KODACHROME'

the new 16 mm. ciné film

Never before has such a simple method of colour photography been available, nor one which gives such amazing results. Any 16 mm. Ciné-'Kodak' or other 16 mm. ciné-cameras taking 50 or 100 ft. rolls, or the Simplex Pockette or Bell-Howell Filmo No. 121, will take 'Kodachrome' movies as easily as black-and-white. No filters or extra equipment of any kind are necessary. Any 16 mm. projector will show 'Kodachrome' with full brilliance.

The colour in 'Kodachrome' is not built up of lines or dots; it is composed of pure colour images only, and contains no silver grains. Definition is critical even when using a large screen. No system of still photography can approach the wonderful results obtained with 'Kodachrome', so now is the time to take up motion pictures.

Write for free descriptive literature or ask your Ciné-Kodak Dealer for a demonstration.

THORNTON-PICKARD
ALTRINCHAM, 7 ENGLAND

A NEW WALLACE HEATON COMPETITION

Here is a new Competition, open only to users of cameras taking 35-mm. film (standard Ciné), Leica, Contax, etc.

The Competition is open from July 1st until September 30th. Your photographs can be of any subject—but they must be taken on 35-mm. film. Prints should be enlarged to 6×4 inches at least.

Any number of prints can be sent in in any one week, but each photograph must have the coupon attached. In addition to the big prize

A WEEKLY PRIZE OF £1-1-0

will be awarded for the best photograph submitted in that week.

Each photograph must have on the back a coupon as below, and the name and address of the sender, the make of camera and material used, exposure, etc.

For photographs which appeal to us, not necessarily prize-winners, we reserve the right to purchase the copyright by payment of £2 2s.; in the case of weekly prize-winners by the payment of an extra 21/-. The copyright of the £25 prize-winning print must be made over to us without further payment.

COUPON which must be attached to your entry **WALLACE HEATON** 35-mm. Film Competition. July 1st, 1936.

In addition, we are offering a special prize of £1 1s. per month for the best photograph submitted depicting a person or persons using a camera purchased from Wallace Heaton Ltd.

All prints will be judged at the end of the Competition for the final prize of £25 cash. Acceptance of these rules and conditions is a specific condition of entry.

FOR USERS OF 35-mm.
STILL CAMERAS
such as the
LEICA, CONTAX, CONTAFLEX, RETINA, ROLLEIFLEX and ROLLEICORD (if used with cine film)

for the best photograph submitted during the run of the competition
£25
will be rewarded

FULL-SIZE view-finder
12 snaps on 8-ex. film
F/6.3 Anastigmat lens
75/- is all it costs !

Voigtländer
BRILLIANT

The f/6.3 model of the famous Voigtlander Brilliant offers unique features, plus a first-class anastigmat lens, at an exceptionally low price. Its hooded view-finder shows the picture crystal-clear and almost FULL SIZE while you take it, and it gives you 12 perfect pictures (2¼ in. square) on a standard 8-exposure 2¼ × 3¼ film. Its Embezet shutter (1/25th, 1/50th, 1/100th sec., T. and B.) has a pin device for delayed-action release. The Brilliant f/6.3 model costs 75/-, there are other Brilliants at 45/- and up to £6 15 0. See it at your dealers or write for the Voigtlander Catalogue.

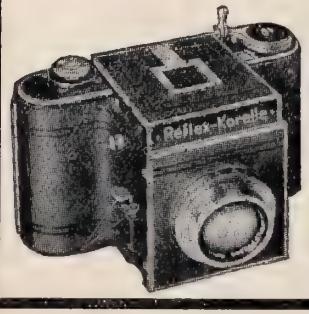
THE BRILLIANT EXPOSURE METER

Slips on to the finder lens of the Brilliant and shows a series of dots in the hood. By taking the dot least visible the right exposure for five different apertures and film speeds can be found. 19s. 6d. in leather purse.

Sole Agents in Irish Free State: Pollock & Co. (Ireland) Ltd., 50, Grafton Street, Dublin, I.F.S.

Of course, you know

that the Camera shown here is a LEICA—one of a wide range that you can see at any time at any of the FOUR WESTMINSTERS. Possibly you have thought that you would like to possess a LEICA—but price, and other considerations, may have caused you to hesitate. It is as well to know that you will find a Leica definitely easier to handle than the other cameras you have had—and it possesses helpful features all its own. You certainly needn't be *afraid* of a LEICA. For the rest, WESTMINSTER'S Liberal Exchanges and advantageous Out-of-Income arrangements are a sufficient answer to such other questions as may arise.



This is the LEICA Model IIIa, having shutter speeds up to 1/1,000th of a second, f/2 Summar lens, and, of course, completely automatic focussing. It costs £43, or can be acquired by 9 monthly payments of £5 0 4. There are other models from £16.

NOW READY!

A LEICA AMATEURS PICTURE BOOK

By Rudolf Pestalozzi.

- Nearly 160 beautiful reproductions enlarged from Leica Negatives WITH FULL TECHNICAL DATA FOR EACH PICTURE.
- The illustrations are printed in various colours in photogravure, and the book is strongly and artistically bound.
- Every miniature camera user who seeks to improve the standard of his photography will find Mr. Pestalozzi's book a source of inspiration.
- The author is an acknowledged expert, and his preface and comments contain much encouragement and very sound advice.

Size 12½" x 9¾". Cloth with gold lettering. Price **21/-** Net. By Post 21/8.

DULL OR BRIGHT

EXPOSURE'S RIGHT WITH

NURO FILM

Sensitive as Sight-British as the Flag

EVEN those who are most careful make mistakes sometimes, and, when pictures are taken hurriedly, exposure errors often occur. That is why you should use NURO—the film with "Lastic Latitude." Not only does NURO's "Lastic Latitude" help you to obtain a consistent negative density in "contrast" subjects, but its high speed fine-grain emulsion and exceptional colour correction ensure crisp clear prints with accurate tone rendering. Try a spool in your camera this week-end and notice the improvement!

Obtainable through all Branches of Boots The Chemists and all good Dealers

THE London Salon of Photography 1936.

SENDING-IN DAY, Wednesday, September 2nd.

THE TWENTY-SEVENTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at The Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 12th September, to 10th October, 1936.

CONDITIONS OF ENTRY (Please read carefully).

1. Pictures must not be framed; but may be mounted or unmounted. Each picture must bear on the back clearly written (a) name of artist; (b) number and title of picture, corresponding to particulars on the Entry Form.
2. When mounts are used they should conform to the following sizes—25 × 20, 20 × 16, or 15 × 12; but no mount to exceed 25 × 20; and it is suggested that white or light-toned mounts be employed. Prints may be of any shape or size, provided they do not exceed the limits of the mounts as given above.
3. All packages of exhibits from abroad must be clearly marked on the outside: "PHOTOGRAPHS FOR EXHIBITION ONLY—NO COMMERCIAL VALUE—TO BE RETURNED TO SENDER." *No prices to be marked on the prints.*
4. Pictures sent unmounted will be suitably mounted by the Salon Committee and all accepted pictures will be shown under glass.
5. Pictures must be sent by post or parcels post, packed flat and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.
6. All pictures for the exhibition must arrive at the above address *on or before* Wednesday, September 2nd. Entries may be delivered by hand at the Gallery on that date only.
7. The Entry Form for pictures from abroad must be sent SEPARATELY by post, together with entry and packing fee of 5s. (this fee covers any number of pictures from one exhibitor). Exhibitors residing in the British Isles may enclose Entry Form and fees with their pictures.
8. Pictures sent by post will be repacked in the original wrappings and returned, carriage paid, after the close of the exhibition.
9. As applications are made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify, in the space provided for the purpose below, whether they have objection to such permission being given. The copyright in all cases remains the property of the authors of the prints.
10. The Committee assure intending exhibitors that the greatest care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.

If pictures are sold a Commission of 15% is payable to the Salon.

The submission of pictures will be understood to imply acceptance of the above conditions.

Notification of acceptance of pictures will be sent out as soon as possible.

A Catalogue will be sent to each exhibitor.

¶ Readers of ***The Amateur Photographer & Cinematographer*** who are preparing work for this year's Salon may use this page as an ENTRY FORM.

SEE CONDITIONS.

¶ Intending Exhibitors who are unable to secure extra Entry Forms in time may prepare their own on plain paper provided the conditions of Entry are adhered to.

ENTRY FORM.

TO THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.

Sir,—I submit the undermentioned Photographs for the consideration of the Selection Committee, and I enclose Postal Order (or International Money Order) of the value of 5/- to cover Entrance Fee and the cost of return postage

Reg. No. (leave blank).	A, B or C (leave blank).	Number on Picture.	Title of Picture.

Leica

THE WONDER CAMERA FOR VERSATILITY

ACTUAL SIZE OF LEICA PICTURES.

It is impossible for owners of ordinary cameras to realise fully what a remarkable range of achievements the Leica is capable of. If you could see the originals of the pictures reproduced here, you'd be amazed at the delicate detail of the flower close-up, and, at the other end of the scale, the enormous depth of focus and lack of distortion in the architectural subject. At landscape, of course, the Leica is a masterpiece, covering the whole field with miraculous definition. It is equally at home with portraiture; indoor subjects, night or day; speed and sport subjects of any kind; and is extensively used for press, medical, scientific and research work. Get a Leica now and enjoy photography to the *full*. Models from ..... **£26 : 10**

A first month's payment of 61/10 secures your Leica. Any apparatus exchanged.

LEICA SERVICE

Our Leica experience is unequalled. We not only sell it, but use it regularly and know what we're talking about. Every accessory always in stock—never any waiting. Also many Leica aids unobtainable elsewhere. Ask for particulars.

Granville PRODUCTS

PRODUCE BETTER PICTURES

Whether used by the novice, the advanced worker or the professional, GRANVILLE PRODUCTS ensure the maximum results with the minimum effort. Every day we receive testimonials from new customers who are surprised and delighted—surprised at the quality obtained at such a low price—delighted with the ease in which such perfect pictures are obtained. If you are just beginning, start right with "GRANVILLE"; if you have years of experience, change to "GRANVILLE." You will never change again!

"THE GRANVILLE GUIDE"

This new publication is a superb 16-page de luxe illustrated edition. Specially issued for users of Granville Photographic Products, it contains up-to-date working instructions, formulæ, and many useful articles specially written by our own experts. A complete list of all materials is also given, including many new lines. If you have never communicated with us before, **write to-day for your copy.** Applications should be addressed to: PUBLISHING DEPARTMENT, Granville Gulliman & Co., Ltd., P.O. Box 3, Leamington Spa.

If you have previously communicated with us, please do not apply, as a copy will be sent to you.

REAL *Colour Photography* FOR YOU

You can take glorious natural colour photographs now on Dufaycolor Film. It gives your camera the means to capture the vivid crimsons, yellows, blues and greens from the palette of nature.

Without special apparatus you can reproduce the whole range of colours in beautiful transparencies. Dufaycolor needs no filters, costs only a trifle more than ordinary black and white photography —and is just as easy.

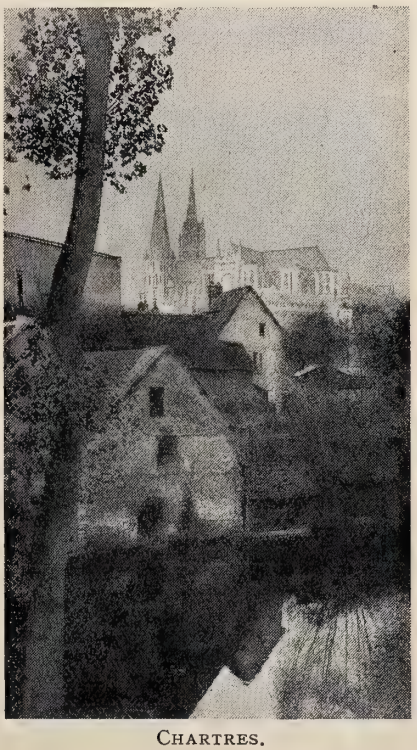
VOL. LXXXII. No. 2486.



TOPICS of the Week

WE are reminded of the progress of the season now that Midsummer Day has passed, by the entry forms of the 81st Annual Exhibition of the Royal Photographic Society and of the London Salon of Photography. The former is obtainable from the Secretary of the R.P.S., 35, Russell Square, London, W.C., and the latter from the Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1. Although both exhibitions will be held from September 12th to October 10th, the sending-in day for the "Royal" is August 14th, while that for the Salon is September 2nd. The conditions governing both these shows remain practically unchanged from last year, but the Salon has an innovation in the form of a leaflet enclosed with every entry form giving practical hints on the sending of pictures to the exhibition. This is well worth getting for the sound advice it contains. We have a supply of both forms available at this office, and copies will be sent to any reader on request.

"The A.P." Photographic Motor Rally.

Several readers have made an excellent suggestion in regard to our proposed Continental Holiday for motorist-photographers that is being organised, and to which further reference is made on another page in this issue. The suggestion as summed up by one reader is: that a list be opened of—(1) Motorists who would take a subscribing passenger, (2) Photographers who would be willing to pay their proportion and go as passengers.

It is likely that some motorists would be pleased to take someone who would share expenses—who spoke French—knew the country—or for other good reasons, perhaps for company. On the other hand, some amateurs who don't motor would like to go. The saved rail fares would be quite a substantial contribution to the expenses of whoever took them. If two lists were opened—possible "inviters" and possible "invitees," each giving a certain amount of preliminary information—there is time for meetings to be arranged for the parties to see whether they are mutually congenial. It might result in many more going, since it would cheapen the expense for both sides. We shall be very pleased to hear from readers to whom this suggestion appeals, either as "inviters" or "invitees.'

CHARTRES.

The Cathedral at Chartres is one of the most beautiful in France, and will be visitedduring "The A.P." Motor Rally.

"Snapshot" Had a Cultured Origin.

One newspaper is offering prizes for "anglesnaps," a word, needless to say, which is not in the "Oxford." But in an idle moment, after making sure it was not in the "Oxford," we turned to find the origin of the word "snapshot," which we had thought to be the slang of the 'nineties, when rapid exposures got going. But that is quite wrong. Apparently the originator of the word "snapshot" was none other than the great astronomer, Sir J. F. W. Herschel, who, writing in a photographic journal—in fact, *The Photographic News*, one of our own ancestors—as far back as 1860, spoke of "the possibility of taking photographs as it were by snapshot—of securing pictures in a tenth of a second of time." It was not until thirty years later that the word became so popular that orthodox photographers looked at it askance.

Thus we find one newspaper in 1891, when the Shah of Persia was visiting this country, declaring that that potentate was an enthusiastic "snapshottist." The vulgarisation comes, not when the act of exposure is referred to as a "snap," but when that word is used of the eventual print. The word "snap" as a substantive has eighteen different significations, but that cannot be permitted as one of them.

Gas-bags (Not the Lecturers).

Manchester has a famous history for lantern slides. In his little book on "Manchester and Photography," Mr. J. G. Chapman mentions that his firm, which was founded in Deansgate by J. T. Chapman, some time in the seventies, had a very large stock of lantern slides for hiring to lecturers, and the lecture sets aroused great enthusiasm. Hilarity rather than enthusiasm was aroused by the method of illuminating the lantern. The illuminants were multiple wick oil-lamps or the oxy-hydrogen jet, the oxygen for which was prepared from chlorate of potash and manganese dioxide heated in a retort. The gas was collected in large rubber waterproof bags, and these were constantly being filled at the Deansgate premises for the use of lecturer customers. It was no uncommon sight to see a lecturer travelling through the streets in a "growler" with one or more of these bags secured on the top. These gas-bags were used between a pair of boards, and the necessary amount of pressure obtained by weights placed on the top, but often it was a small boy from the audience who supplied the necessary weight by sitting on it, much to his delight and pride, especially if the lecture was dull. Mr. Chapman says that at the height of the popularity of the lantern slide his firm stocked more than half a million.

"The Amateur Photographer" EXPOSURE TABLE — *July*

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The subjects will be varied to suit the time of year. The following exposures will serve as a working guide for any fine day during the month, between the hours of 10 in the morning and 2 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured, or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 8 to 10 a.m. or from 2 to 4 p.m. double these exposures. From 6 to 8 a.m. or from 4 to 6 p.m., treble them. From 5 to 6 a.m. or 6 to 8 p.m., about four times these exposures will be required.

N.B.—The times given above are by "sun time." The exposures, therefore, which are laid down as suitable for 2 to 4 p.m., for instance, will be those to be given between 3 and 5 p.m., by the clock, during "summer time."

Subject.	Ordinary.	Medium.	Rapid.	Extra Rapid.	Ultra Rapid.
Open seascapes and cloud studies	1/40 sec.	1/60 sec.	1/120 sec.	1/160 sec.	1/200 sec.
Open landscapes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes ..	1/25 ,,	1/40 ,,	1/75 ,,	1/100 ,,	1/125 ,,
Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes	1/18 ,,	1/30 ,,	1/50 ,,	1/70 ,,	1/90 ,,
Landscapes in fog or mist, or with strong foreground, well-lighted street scenes ..	1/10 ,,	1/15 ,,	1/30 ,,	1/40 ,,	1/50 ,,
Buildings or trees occupying greater portion of pictures, river scenes with heavy foliage	1/2 ,,	1/12 ,,	1/25 ,,	1/30 ,,	1/40 ,,
Portraits or groups taken out of doors, not too much shut in by buildings.. ..	1/2 ,,	1/3 ,,	1/6 ,,	1/8 ,,	1/10 ,,
Portraits in well-lighted room, light surroundings, big window, white reflector ..	3 secs.	2 secs.	1 ,,	3/4 ,,	1/2 ,,

As a further guide we append a list of some of the best-known makes of plates and films on the market. They have been divided into groups, which approximately indicate the speeds referred to above. The hypersensitive panchromatic plates and films require less exposure than the ultra-rapid.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Newspaper Photograph Competitions

The season for newspaper photograph competitions has again started and is now in full swing. Cash prizes of large and small amounts are being offered on all sides, and are to be won by the amateur photographer who is prepared to adapt his ideas and technique to the requirements of the newspapers offering them.

THE first thing to realise when entering for newspaper photograph competitions is that the prizes rarely go to "lucky snaps." The prizes offered are very generous, and even the minor reproduction prizes are well worth having, so that these competitions attract the attention of many keen workers who are prepared to go to quite a lot of trouble in an effort specially directed to securing a prize.

Prints entered should, of course, conform with the subject matter requirements of the competition concerned, although these are very comprehensive and allow plenty of scope for originality and individual treatment. Apart from this, however, it can be considered essential that the subject should be of a very decided human interest, appealing to a wide public.

Art editors are not concerned so much with Art as with what will appeal to their readers.

Likely Subjects.

Animals and children, particularly together, are always prime favourites, although they are run a close second by old-fashioned and picturesque characters. Gipsies and shepherds in the country; horse-cab drivers and chimney sweeps in town, and other similar characters, should provide opportunities for all, and are certain to receive attention, particularly when treated with more than a touch of sentiment or humour. Another favourite in certain quarters is the pretty girl at the seaside or in picturesque surroundings.

The unusual angle of view is a favourite and should be employed when the subject lends itself to this treatment. In this respect it is worth noting that the low viewpoint (looking up), is becoming more popular than the high viewpoint (looking down).

A great deal has been written about the necessary qualities of a good Press photograph, but it has rarely, if ever, been pointed out that the most important quality of a print for reproduction is that of a good scheme of tones.

The masses of light and shade should be well arranged and balanced, and the print must not rely upon delicate tones for its appeal. Sharp definition, good contrast, both are important, but less so than good, well-defined tone masses carrying the story of the picture. The picture that tells its story by delicate tones or intricate detail is useless, because these are inevitably lost in the printing of the paper. This point is always taken into account by Art editors with an eye to reproduction value.

When this point is realised it will be taken into consideration when the subject is being arranged and the exposure made, so that the final process of making the print will be greatly simplified. If the subject can stand the loss of tone values involved by the use of a too contrasty grade of paper it will be ideal for newspaper reproduction.

Competition Prints.

It would appear from the Readers' Questions page of *The Amateur Photographer* that many readers are in doubt as to the best type of print to submit. This doubt, in these days of large entries, may lead to the loss of a prize, which the negative merits but the print does not.

The problems that most frequently arise are:—

(1) What surface shall I use?
(2) What size shall I print?
(3) Should I mount my entries?

The question of what surface to use, depends first on the competition the print is entered for, and secondly on the subject of the photograph. If the print is entered for a daily or weekly newspaper competition, where if it wins a prize it will be reproduced in the paper concerned, it should be printed on a glossy paper, and glazed. On the other hand, if the print is to be submitted for a competition run by a photographic paper, such as *The Amateur Photographer*, or by a photographic society, the print should be made on the paper that suits the subject. For instance, a photograph that depends for its success on the effect produced by sunlight, should be printed on a cream base rough paper, while the photograph with much small detail in it should be printed on a smooth surface paper.

On the question of size the prints should be big. In all ordinary circumstances the print should never be smaller than whole-plate, unless the conditions of the competition stipulate a maximum size to be submitted which is smaller than this. But do not enlarge too big. A good 10×8 print will be much more effective than a poor 15×12 print that is very grainy, or suffers from other serious faults.

In regard to mounting. In newspaper competitions do not mount your prints, but in all other cases where mounting is allowed it is as well to do so, as a tasteful plain mount enhances the appeal of the picture.

When submitting prints for an exhibition the photographer wisely chooses just a few of his best. When submitting them for newspaper competitions it is a case of the more the merrier. Prints should, however, be submitted at reasonable intervals; they are otherwise liable to compete with each other in the daily or weekly selection that is made for reproduction prizes.

In order to ensure that the print survives the handling of the postal authorities and reaches its destination in a presentable form, it should be protected by a stout piece of cardboard which just fits the envelope, and held in place by a thin rubber band. The envelope should be marked "Photographs, please keep flat."

Lastly, make quite certain that all the conditions of the competition are rigidly adhered to, particularly with regard to copyright and prior publication, and whatever else you do, do not enter the same or even similar subjects for two different competitions.

Among the London daily and weekly newspapers running photographic competitions for cash prizes are the *Daily Sketch*, *Sunday Graphic*, *Sunday Referee*, *Daily Herald*, *News Chronicle*, *Weekly Illustrated* and *Sunday Pictorial*. There are also many other provincial daily and weekly papers which are running competitions. Our readers should obtain copies of those mentioned above for further information regarding them.

Photography for CLIMBERS

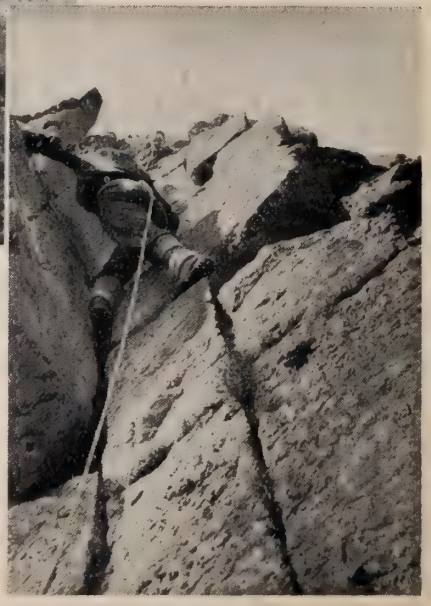
By G. L. BOEDEKER.

NOW that cheaper motoring and railway fares have made the climbing districts more accessible, climbing in England has become deservedly popular, and during holiday time a surprising number of bands of climbers are seen trooping home from the hills every evening. Although this pastime gives unique opportunities to the photographer, one does not see many photographs produced that can compare with the many fine pictures taken while walking in the country at lower levels. This is probably due to photographs often having to be taken quickly while climbing and the difficulty in getting the camera ready.

To obtain good results it is a great help to use one of the many types of miniature cameras now becoming so popular, and the accompanying illustrations were taken with one of these cameras, although an inexpensive model was used. To enable the camera quickly to be brought into action, it is a help, and also a safeguard, to have the camera secured to a small strap hanging round the neck; when not in use the camera can be buttoned up, out of harm's way, under one's jacket. Many of the more expensive cameras can be supplied with "ever-ready" cases in which the camera remains while in use, and these are ideal for the purpose. The strain of climbing sometimes makes it difficult to hold the camera steady at the shutter speeds in normal use, and to avoid the risk of movement it is advisable to use a speed of not less than 1/50th of a second.

Rounding the Corner.

A half-way rest.



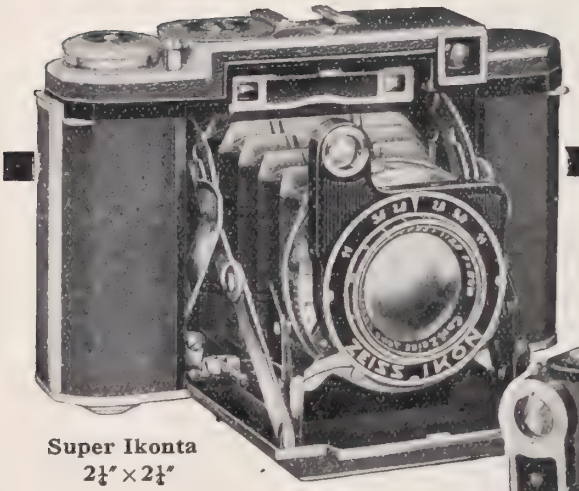
Preparing for the Ascent.

As regards composition, backgrounds consisting of many rocks and boulders should be avoided as it results in a picture confusing to the eye, and in many cases it is advisable not to use too small a stop so as to avoid too much detail in the background. It is important to get a portion of the foreground showing in the picture, and this must always be sharply focussed. Usually it is best to get as close as possible to the climbers, and where possible to get them outlined against the sky. It is nearly always best to use a panchromatic film as the rocks are rendered in a lighter and less obtrusive tone, and a good rendering of the sky can be obtained even without the use of a filter, although a filter usually improves the picture considerably.

One point to remember is not to make an exposure immediately after a strenuous climb or vibration may occur.

If the above hints are borne in mind, and care is taken in the composition, many vivid pictures will be brought back from the day's climb, and serve as a memento of the climb.

A tricky bit.



A familiar scene at every seaside resort during July and August

Really Good Pictures of the Ensign Plane taken on Ensign Film will be wanted for advertising purposes. Send results, with **empty carton,** to Advertisement Dept.,

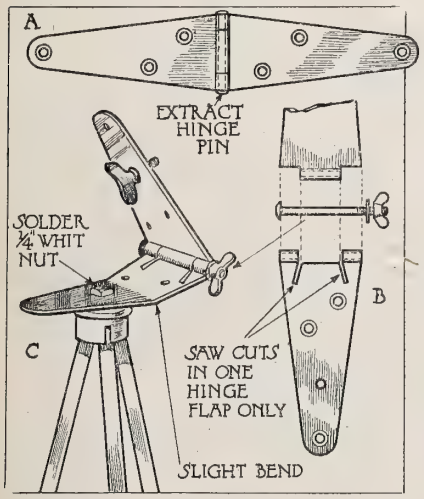
Readers' Hints, Tips and Gadgets

SHEATH FOR PROCESSING DUFAY AND OTHER FLAT FILMS.

THOSE workers who have used flat films and have processed them themselves will have found that the films curl badly in the processing bath. The two obvious cures of using plenty of developer in a deep dish and of holding the film under the surface by hand are objectionable because, on the one hand, developer can only be used once, so that economy is desirable, while, on the other, the emulsion surface is extremely delicate while wet.

To overcome this difficulty I made the sheath shown in the sketch. It is constructed of a sheet of stout celluloid, which may be obtained at some garages quite cheaply. An old glass negative of the same size as the flat film is cleaned of gelatine and clipped to the sheet of celluloid. This should be cut as long as, and about three-sixteenths of an inch wider than, the glass, leaving equal margins on each side. The whole is placed in water as hot as the hand can stand, so that the celluloid becomes soft enough to bend. The margins are bent round the glass until the shape shown in the diagram is roughly attained. The glass is then removed and bending completed.

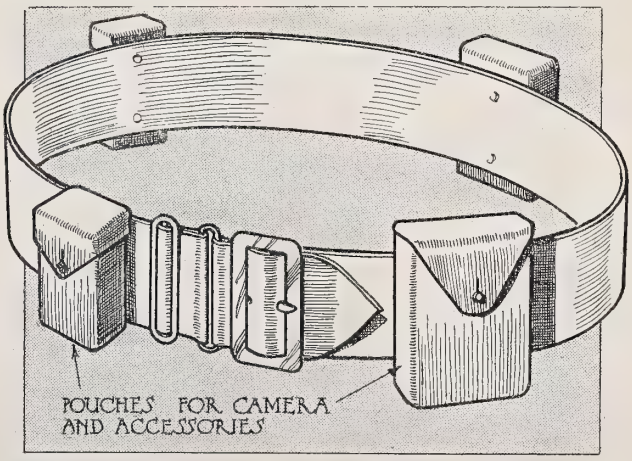


Such a sheath holds the film flat, so that the minimum quantity of solution is used, and the sheath and film are as easy to handle as a plate. F. E. L. PARSONS.

AN EASILY-MADE TILTING TOP TRIPOD HEAD.

THIS useful accessory to the tripod can be fashioned at little expense from an ordinary large strap hinge as shown at A, and can be used, with the camera pointing downwards, for table-top work, copying and similar purposes. Architectural work can be done with the camera pointing upwards.

To provide a means of locking the device the hinge pin is removed by filing away the riveted end and punching it out. Two saw-cuts are then made in the "mortise" part of the hinge, i.e., the half which has the two rolled parts (see sketch at B). This provides sufficient "give" to allow a locking-screw and nut to function. The screw must, of course, have the same gauge as the discarded hinge pin. A butterfly nut, with spring washer, provides the means of locking. To attach the device to the tripod screw, which is usually ¼-in. 20-thread Whitworth, a nut of this size is rigidly fixed in the centre of one leaf of the hinge by welding or soldering the nut over a hole of 5/16ths diameter to clear the tripod screw. A ¼-in. 20-thread Whitworth short screw, to attach the camera, goes through a hole in the other leaf of the hinge, and it is advisable that this screw is not immediately over the tripod screw nut on the lower half of the hinge. This screw should have a butterfly head to allow of finger tightening, and to accommodate this head the bottom leaf of the hinge should be bent at a slight angle, as shown in C, so that the camera is level when the hinge is closed with the camera and screw in position. C. FINLAYSON.



CARRYING A MINIATURE CAMERA.

FOR a long time I have been trying to find a way to carry a miniature camera and accessories, such as screens and an exposure meter, so that the outfit should not hamper walking. I found that the camera is a noticeable drag in the pocket, and if a sling case is used the strap is unkind to the shoulder, and is contantly dropping off.

But I have now found the right way.

Buy a "working man's" belt, made of webbing about 3 in. wide. Around this belt fix pockets like on a cartridge belt. I made my pockets out of soft leather-cloth, so that I could myself stitch them on to the belt, but, if a little extra thickness is not objected to, a sounder job would be to have the pouches made of leather and let a saddler stitch them on to the belt. I have used snap-fastenings to keep the flaps of the pockets closed; but a saddler will probably put stud-and-buttonhole clips like those on a cavalryman's bandolier.

Have as many pockets as possible. That is to say, split up the components of the camera and accessories into as many pieces as you can. And take great care how you distribute the pockets round the belt. A difference of an inch in the placing of a pocket can make much difference to how much the loaded belt will bulge your jacket and to whether the weight is going to feel well balanced.

When the belt is loosely fastened it settles down into the most comfortable position. H. J. HINE.

WIN

By GWYNETH PENNETHORNE.

The Old Well-head.

WINDOWS have evolved from the narrow loopholes or lancets, allowing a minimum of light and air to pass, which were necessary in mediæval times, to things of beauty. Architects now exercise all their skill on the windows of a house, and its window may be the chief feature of a room; in fact, in some instances the modern room may be said to be "built round the window."

In cases such as this the photographer who wishes to take an interior view should not hesitate to include the window in his picture. The old bugbear of halation need not be dreaded if backed plates or double-coated films are used, though naturally one would choose a time of day when the sun is not shining directly on the glass.

In some cases even this can be undertaken—the play of shadow making a picture in itself.

Many people nowadays plan their house and garden in one. That is to say, they arrange that the garden shall look its best when viewed from the house. Sometimes a vista is planned; at others some special feature of the garden—the rockery, bird-bath or old well-head—is to be seen.

Through the porch window.

Do not hesitate to include a window.

It is a well-known fact that a garden often looks far brighter and more attractive when seen from the house than from the outside. This is due in part, I think, to the effect of sunshine being enhanced by the

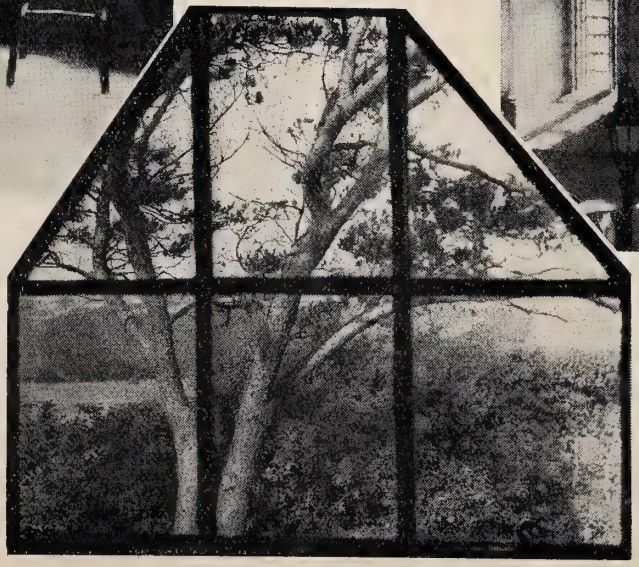
THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

DOW PICTURES

comparative dimness of the indoor light, and in part to the effect of framing given by the window.

The camera is well able to reproduce both these effects. The room acts as a large lens-hood, so preserving the brightness of the view, while the window-frame can often be included in the picture.

A Sussex Garden.



It is difficult to avoid slight halation under some conditions, even with a film.

The greatest difficulty, when much of the room is being included, is that of equalising the exposures necessary for the room and for the landscape. If a meter test is made of each for the same stop and plate, the difference will be amazing. A good plan used by commercial photographers is that of using as much artificial light as possible in the room while the exposure is made.

Another plan is to hang a dark cloth over the window from the outside, and make a partial exposure on the interior. The lens is then capped, the cloth taken down, and a supplementary exposure given to record the detail outside. This second exposure naturally affects the interior at the same time, and some judgment is required to time the double exposure so that the final effect looks natural.

The play of sun and shadow will often make a picture.

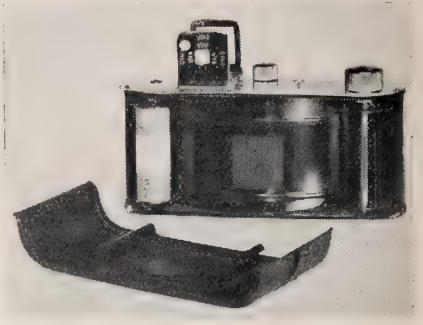
A quaint window framing the view.

Subjects of this class generally come in the category of "extreme contrast," and this suggests the necessity for full exposure followed by shortened development.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

Cash Prizes totalling £1,500 are being offered this summer by the *Daily Sketch*, in conjunction with the *Sunday Graphic*, for amateur snapshots. Every week two prizes of £50 each, two of £10 each, 20 of £1, and 20 of 10s. are awarded for the snapshots that are adjudged best. There are no conditions and no limit to the range of subjects, which, however, should be of a bright and happy holiday character. The entries are judged by the Editor of the *Daily Sketch* and the Editor of *The Amateur Photographer*. Full details of the competition are published every day in the *Daily Sketch*.



Messrs. Ilford Ltd. have asked us to call attention to the fact that they have adopted green duplex paper for all Selo panchromatic films in place of the red and black paper previously employed. This departure will be appreciated by all photographers, as the use of green paper will facilitate processing by ensuring handling in the correct light.

The 13th Midland Salon of Photography was opened on June 20th, in the Art Gallery at Hanley, Stoke-on-Trent, and remains open until July 18th. It is well worth a visit, as the work of a strong selection committee has resulted in a very high standard of excellence in the exhibits. In addition to the work of members of the Midland Federation there is an interesting and attractive open section, and the lantern slide class is a strong one. The cordial co-operation of the Art Gallery authorities and of the local Press has done a great deal to make this Salon an outstanding success.

"Anecdotes, plus some Puzzles," the competition-lecture by Mr. Geoffrey E. Peachey, Advertisement Manager of *The Amateur Photographer*, is available for delivery to photographic societies between October, 1936 and March, 1937. The Proprietors of *The Amateur Photographer* will award a copy of Wall's "Dictionary of Photography" as a prize upon each occasion of the delivery of this lecture. No fees will be charged, but travelling expenses will be payable. Applications, with a list of vacant dates, should be made to Mr. Peachey at Dorset House, Stamford Street, London, S.E.1, not later than 31st July.

A highly interesting and instructional book for the pictorial worker has just been published by Ensign, Ltd., High Holborn, London, W.C.1. It is titled "Composition for Photographers," and is by Richard N. Haile, the immediate past president of the P.P.A. Written and profusely illustrated with innumerable diagrammatic sketches in wash and line, and many appropriate photographic studies, it sets out to explain composition in a very palatable manner, or, as the author prefers to put it, "the aim has been to crystallise into tabloid form the copious teaching of many accepted authorities, for the benefit of those who have neither the time to study large volumes on the subject nor the knack of extracting instruction from such." It is eminently suited to the beginner, although the advanced worker will profit much by it. Altogether it is a book we can thoroughly recommend and well worth a place in the pictorialist's library. The price is 10s. 6d.

A new miniature camera, surprising both in its low price and performance, has just been put on the market by R. F. Hunter, Ltd., of "Celfix House," 51, Gray's Inn Road, W.C.1. It is called the "Purma," and is an all-metal production with focal-plane shutter giving a range of speeds from 1/25th to 1/200th sec. It is fixed focus for everything from 6 ft. to infinity, and has many features that will appeal to the beginner as well as the more advanced worker. The "Purma" takes sixteen pictures one inch square on the standard V.P. roll film. The shutter is most ingenious in construction and singularly efficient. As shown in the illustration of the camera with the back removed, the inner part taking the film is curved, and the focal-plane shutter follows this curve. The shutter is spring-actuated, but relies also on gravity for speed variations, and these appear to be very accurate. Some remarkable results have been obtained with the

"Purma" under adverse lighting conditions considering the small aperture of the lens, and there is no doubt of the successful results obtained when dealing with high-speed shots. Last, but not least, it is entirely British, both in its conception and manufacture, and costs only 35s.

The winner in the latest Wallace Heaton competition is B. Smith, 57, Osborne Road, Willesborough, Ashford, Kent. Particulars of these competitions for "A.P." readers will be found in our advertisement pages.

Messrs. Johnson & Sons, of Hendon Way, Hendon, N.W.4, ask us to correct an error that appeared in our issue of June 17th, in which we referred to the price of gold chloride as 4s. 8d. per 15-grain tube. The price to-day is 5s. 6d. per tube.

The latest booklet from the firm of Zeiss Ikon is a notable production of 24 pages printed in photogravure. In addition to well-written notes on the Zeiss cameras, every page is adorned with excellent examples of the pictures taken with them, and is most convincing proof of their excellence. Our readers will like this booklet, and should write to Zeiss Ikon, Ltd., Mortimer House, 37–41, Mortimer Street, London, W.1, for a free copy.

"The A.P." Monthly Competitions

AWARDS FOR MAY.

A PARTICULARLY attractive lot of pictures were entered in the Advanced Workers' Section of the May competition, and the standard of merit throughout was of a very high level in all sections. The awards are as follows:

ADVANCED WORKERS' SECTION.

First Prize.—"The Mill, Fleet Dyke," by Arthur G. Dell, 88, Casewick Road, W. Norwood, London, S.E.27.

Second Prize.—"A Yorkshire Windmill," by Dr. S. D. Jouhar, 50, Crown Road, Twickenham, Middlesex.

Third Prize.—"Clouds and Profile," by J. H. Clark, 304, Camberwell New Road, London, S.E.5.

Mounting Prize.—"Old Brass," by James C. Gilchrist, Llanover, Pitlochry, Perthshire.

Certificates of Merit.—"English Breeze," by M. L. Haselgrove, 18, Maiden Castle Road, Dorchester, Dorset; "In the Air," by G. Tschernochvostoff, Mechelfingatan 26 B 12, Helsingfors, Finland; "An Optimist," by Yahya Arif, De Menashe Avenue, Maadi, Cairo, Egypt.

The prints not receiving awards have been grouped, those in the first group receiving Honourable Mention. The others have been marked Class 1, Class 2 and Class 3, respectively.

Those awarded Honourable Mention are as follows: J. F. Cutler (Edgware); Mrs. M. E. Cutler (Edgware); Arthur G. Dell (London, S.E.); (2) Miss Violet M. Emms (Hampton Wick); A. Howard Garmston (Bristol); M. L. Haselgrove (Dorchester); James C. Gilchrist (Pitlochry); George Hilleard (Bromley, Kent); T. F. Holdsworth (Wakefield); (2) Wm. Jackson (Hull); Francis E. Jones (Tyldesley); (2) Dr. S. D. Jouhar (Twickenham); Emile Laevaert (Brussels); (2) Mrs. K. M. Parsons (Reading); Miss G. Pennethorne (Haywards Heath); George A. Slight (Forest Hill, S.E.); Denis Whitlock (Shortlands, Kent).

INTERMEDIATE SECTION.

First Prize.—"Maths.," by Frank D. Eades, Inglewood, Glen Hill, Blaby, Leicester.

Second Prize.—"Sunlit Sail," by Edwin H. Kew, Reinbron, Cradock, C.P., South Africa.

Certificates of Merit.—"Chicks," by R. A. Moore, 14, Childwall Mount Road, Liverpool, 16; "Cathedral Spire," by J. R. W. Mundy, Duala, S. Fairlee Road, Newport, Isle of Wight; "Ann," by R. M. Roberts, Cothercott, Evelyn Drive, Pinner, Middlesex; "Aground," by Sydney Smith, 13, Market Place, Pickering, Yorks.

BEGINNERS' SECTION.

First Prize.—"Church Lane, Chester-le-Street," by F. Price, South View, Chester-le-Street, Durham.

Second Prize.—"Transvaal Valley," by Miss G. M Silcock, Arthfield House, Thornton-le-Fylde, Lancs.

Certificates of Merit.—"Harmonica," by James A. McKenzie, 76, Priestfield Road, Edinburgh, 9; "The Veteran," by W. H. Phillips, 21, Barnes Avenue, Margate; "Lime Kiln Worker, Swabue, S. China," by Mrs. O. M. McQuillan, 1, Cholmeley Lodge, Highgate, London, N.6; "City Hall, Cardiff," by G. Willis, Henstaff Court, Pontyclun, Glam.

News!

BETTER PICTURES — BIGGER ENLARGEMENTS

for miniature camera users

Three new Selo films specially for use in Leica, Contax and similar miniature cameras have been produced by Ilford Limited.

These films not only combine extreme sensitivity with fineness of grain — making it possible to obtain bigger enlargements from miniature negatives — but they are contained in a new, special Daylight Cassette of patented design which gives greater safety in handling, prevents scratching and obviates friction.

SELO H.P. FILM

Fine Grain Hypersensitive Panchromatic

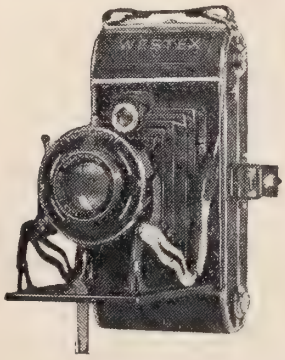
As fast as a fine grain film can be and remarkable for its complete absence of coarseness of grain. It enables difficult subjects with fast movement to be photographed with the certainty that well exposed negatives capable of enlargement to great size will be obtained.

SELOCHROME FILM

Fine Grain Orthochromatic

A splendid all-round film for almost every type of miniature photography by daylight. Prepared for the photographer who wants a film of really fine grain at a low price. Anti-halo backed.

Your photographic dealer can supply these films.



Made in England by ILFORD LIMITED, ILFORD, LONDON

Get it at the WESTMINSTER——you cannot do better: Largest up-to-date Stocks; most Liberal EXCHANGES; best EXTENDED PAYMENT PLAN • • • • • • • •

The Amazing "WESTEX" Roll Film Cameras . . . . .

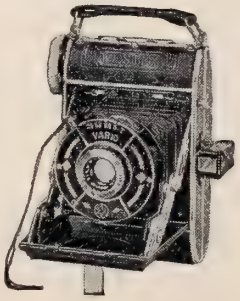
"INCOMPARABLE" WESTEX 'Four-Five'

REFINEMENT AND HIGH PRECISION THROUGHOUT

8 or 16 on normal 3¼×2¼ film.

Very highest quality in every detail. Superb f/4.5 anastigmat, giving exceptionally fine definition, in focussing mount, delayed-action Prontor II shutter, 1 to 1/150th sec., T. and B. Sturdy all-metal body, plated edges, best leather covering and bellows. Quick, self-erecting front. Optical direct-vision and brilliant waist-level finders. Hinged easy-loading back, panchromatic safety windows. Easy and delightful to handle, yet suitable for the most advanced work anywhere. By far the best all-round value offered. Obtainable only at the Westminster. **£4:8:9**

Nine monthly payments of 10/5.



Velvet-lined Leather Case, 6/9 extra.

"WESTEX JUNIOR"

Takes 8 pictures 3¼×2¼ on standard film.

Fine f/6.3 anastigmat in focussing mount. Self-erecting front, ready at a touch, direct-vision and brilliant finders. Quite unparalleled at its price..... **42/6**

Nine monthly payments of 5/3.

THE "WESTEX MINIATURE"

A most efficient high-precision camera at a marvellously low price. 16 pictures 4×3 cm. on standard V.P. spool. Splendid results, easy manipulation. Quick, self-erecting front, f/4.5 Vidanar anastigmat lens, focussing down to 3 ft., Vario shutter, 1/25th, 1/50th, 1/100th sec., T. and B. Direct-vision optical finder. Beautifully made, very compact, slips easily into your pocket.

Price (as above)..... £3:12:6

Nine monthly payments of 8/7.

With Radionar f/2.9 anastigmat and Prontor shutter, 1 to 1/175th sec., T. and B. **£5:12:6**

Nine monthly payments of 13/2.

NEW ZEISS IKON SUPER IKONTA II

Eight 3¼×2¼ or 16 2¼×1¼ on standard film.

All metal parts matt chromium finish; film winder and shutter interlocked, entirely preventing double exposures. Albada direct-vision finder, Tessar f/3.8, Compur Rapid delayed-action shutter 1 to 1/400th sec.

£27:0:0

Nine monthly payments of 63/-.

NEW KODAK 'REGENT'

Takes 8 3¼×2¼ or 16 2¼×1¼ on normal film.

Latest modern streamlined construction. Self-contained range-finder, coupled with lens, f/4.5 Tessar and Compur Rapid shutter, 1 to 1/400th sec., delayed-action device, including leather case.... **£20:0:0**

Nine monthly payments of 46/8.

THE NEW 'WELTUR'

Built-in Range-finder and View-finder combined.

Takes 16 2¼×1¼ on standard 3¼×2¼ spool. High precision camera with self-erecting front, and every up-to-date refinement at moderate price.

F/2.9 Radionar, normal Compur shutter.

£17:17:6

Nine monthly payments of 41/8.

F/2.8 Zeiss Tessar, ditto

£22:19:6

Nine monthly payments of 53/7.

Compur Rapid shutter, 28/6 extra.

'KORELLE' REFLEX

Twelve 2¼×2¼ on normal 3¼×2¼ film.

Coupled shutter and film wind, no double exposures. Scales read from above. Interchangeable lenses. Shutter to 1/1,000th sec., wire release.

F/3.5 Radionar

£12:12:0 Nine monthly payments of 29/5.

F/3.5 Tessar

£17:17:0 Nine monthly payments of 41/8.

6-in. Dallmeyer Dallon Telephoto, extra

£9:9:0 Nine monthly payments of 22/1.

The New ZEISS IKON CONTAX II

Exclusive Zeiss Ikon wedge-type distance meter now combined with view-finder. Shutter speed increased to 1/1,250th, all speeds always clearly visible, delayed-action release.

F/3.5 Tessar..... **£40:10:0**
Nine payments of 94/6.
F/2.8 Tessar..... **£43:5:0**
Nine payments of 100/9.
F/2 Sonnar..... **£50:10:0**
Nine payments of 117/10.
F/1.5 Sonnar..... **£65:15:0**
Nine payments of 153/5.

VERY SPECIAL

CINÉ BARGAINS at 24, CHARING CROSS ROAD ——— W.C.2

TEMple Bar 7165

• HERE & NOW •

There is no better time of year for taking up "Home Movies" than NOW, and HERE are the finest ciné cameras, reconditioned and fully guaranteed, and very much under original cost. Below are listed a small selection—a postcard will bring you further details of any model in which you may be interested, or we shall be glad to quote specially, or send on approval against full cash deposit, if desired.

9.5-mm. Pathescope Motocamera B, f/3.5 lens. List price £6 6s..... **£4 10 0**

9.5-mm. Pathescope Motocamera de Luxe, f/3.5, leather covered, enclosed optical finder. List £10 10s..... **£5 17 6**

9.5-mm. Pathescope Motocamera de Luxe, f/2.5 and Telephoto attachment. Unused and unmarked. List price £18 18s. **£12 17 6**

9.5-mm. Coronet, latest model, f/3.9 lens. List price £3 15s..... **59s. 6d.**

9.5-mm. Dekko, latest model, new type gate, 1-in. f/1.9, focussing, interchangeable mount, multi speede. Exactly as new. List price £10 18s. 6d..... **£8 5 0**

9.5-mm. Coronet, 1935 model, f/3.9 lens. List £3 5s..... **37s. 6d.**

16-mm. Cine-Kodak B, 1-in. f/1.9 focussing anastigmat, interchangeable with 3-in. f/4.5 focussing Telephoto, all chromium, complete in case. Listed £47 10s. **£25 17 6**

8-mm. Cine-Kodak 8-30, f/3.5 lens. As new. Listed £9 17s. 6d..... **£7 17 6**

16-mm. Ensign Super Kinecam, 3-lens turret head, 1-in. f/2.6 Cinar, multi speeds and hand crank. Listed at £45 **£29 17 6**

16-mm. Agfa Movex, f/3.5 focussing anastigmat. Film capacity 40 ft. As new. List £15 15s..... **£7 12 6**

16-mm. Cine-Kodak BB Junior, f/3.5, 50-ft. model, and case. List £15 15s. **£7 10 0**

16-mm. Siemens Model C, 1-in. f/1.5 Meyer anastigmat, focussing mount, multi-speeds 8, 16, 24, 64 and single exposures. Complete with range-finder and case. Cost over £60 **£43 17 6**

9.5-mm. 30-ft. Model Cine-Nizo, f/2.8 Cassar anastigmat, for Pathec hargers. List £15 15s. **£7 7 0**

16-mm. Cine-Kodak BB, 2-speed model, f/1.9 Kodak focussing anastigmat, interchangeable with 3-in. f/4.5 Telephoto, 50-ft. model, complete in case. Equal to new. Cost over £45 ..... **£24 17 6**

16-mm. Cine-Kodak BB, f/1.9 focussing anastigmat, interchangeable mount, speeds 8 and 16. As new. List £27 10s. **£17 17 0**

8-mm. Cine-Kodak 8-60, f/1.9 lens, complete and as new. Listed £15.... **£12 17 6**

9.5-mm. Pathescope Motocamera B, f/3.5. List £6 6s..... **£4 5 0**

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

How to Reduce Hard Contrasts in Negatives

By HAROLD G. GRAINGER.

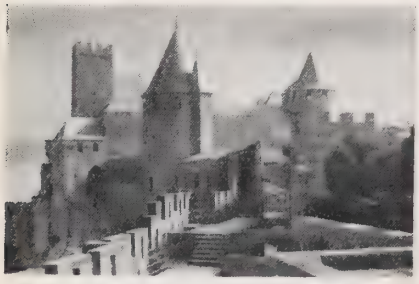
ONE of the most common faults that occur with amateur photographers' snapshot negatives is excessive tonal contrast. This is due generally to under-exposure, coupled with full development, although the effect is sometimes produced accidentally by the unintentional employment of a developing solution of too high a temperature in conjunction with a subject that originally has harsh contrasts, such, for example, as a sun-illuminated whitewashed cottage against dark foliage. A subject such as this would require very careful development to avoid excessive density in the high-lights, and the best method in such circumstances is to limit the developing time to half or two-thirds the usual.

(A)

(B)

—"*Shall we go Shopping?*"—

Fortunately, it is an easy matter to reduce excessive contrast in the tones of a negative and produce perfectly satisfying results. Other methods are, of course, available than the following, but this has the advantage of leaving the negative image permanent and does not increase the grain. Another useful feature is that it is equally applicable to the correction of any degree of excess contrast, and if the first endeavour to amend the gradation is not successful the process may, without risk of damage, be repeated.



The procedure is as follows: The negative, which should be perfectly hypo-free, is first thoroughly bleached in a solution similar to that used in sepia-toning bromide prints —100 grs. of potassium ferricyanide and 300 grs. of ammonium bromide in 20 oz. of water. After washing, the bleached image is redeveloped in a well-restrained, non-staining solution of, say, Azol, Rodinal or Certinal, etc.—1 dram with 5 drams of 10 per cent solution of potassium bromide to 6 oz. of water. Action is slow—a few minutes' immersion may suffice, or it may be longer. The darkening of the image should be watched carefully, and as soon as the desired strength is reached, which will be before the image is darkened right through, the negative is fixed, washed, and dried as usual.

The comparative prints of a figure subject, "Shall we go shopping?" demonstrate the possibilities of the method. Examine them and note that (A) from the negative as developed, even though printed on "soft" bromide paper, fails entirely to reveal the delicate values which are so important. By the time the shadows had attained necessary density the cream silk dress of the girl almost failed to show any tone. Even the formation of the steps on which she stands cannot be traced. Nor do the window-frame and lace curtain or the mouldering stone wall appear as they ought. Sufficient exposure to produce tone on the dress and steps made things, if anything, worse. Bleaching, washing and redeveloping (ten minutes for this) as described, and drying, enabled print (B) to be obtained, which gave a satisfactory rendering throughout the scale of tones from an easily printable negative.

OUR CONTINENTAL MOTOR RALLY FOR AMATEUR PHOTOGRAPHERS

FURTHER details concerning the Photographic Motor Holiday in August have now been issued by Autocheques, Ltd., of Piccadilly House, 33, Regent Street, London, S.W.1, and will be sent to any reader on application to that address.

In the meantime we would again draw attention to the remarkable itinerary that has been arranged and which was given in full in our issue of June 17th. The low inclusive cost of the fifteen days' tour is worth the attention of any one who is a motorist and wishes to visit the Continent with the car but under ideal conditions, and with a minimum of trouble. Not only does the selected route run through the finest parts of France for picture-making—right down to the Riviera and back—but the service includes all transport matters for the car and its passengers across the channel and return, the necessary papers, etc., for touring France; landing and embarkation charges at Calais; British dock dues; reserved accommodation at selected hotels throughout the tour, dinner, breakfast and all gratuities; garage accommodation, and the services of an experienced pilot linguist mechanic throughout.

Carcassonne, the wonderful mediæval walled city of the Loire valley.

All these items are included, and the motorist-photographer will have nothing to worry about except to drive and stop where he chooses to take pictures, and material for these will abound throughout the entire trip.

In reply to several readers, one point in connection with the Rally should be made quite clear. This is that the possession of a fast, large or powerful car is absolutely unnecessary.

The main roads of France, over which most of the route lies, are among the best, if not *the* best, in Europe. The surfaces are superb, gradients seldom exceed one in ten, and fuel stations abound.

The smallest British car is fully equal to the journey proposed, and it is unnecessary to carry any other spares than would normally be carried when touring at home.

The only word of advice which it is well to give is to see that all the tyres are in good condition before the start. Tyre troubles can mar any tour; four good ones at the start ensure pleasant days.

Petrol and oil are obtainable everywhere. Although petrol is expensive judged by our standards, the extra cost of fuel at 3s. a gallon over that costing 1s. 6d. in a thousand miles with a car doing twenty-five miles to the gallon only amounts to £3, surely a small price to pay for such a trip as is proposed. Say £1 per passenger, taking an average of three people to each car.

Oil need not trouble any one. The French Customs do not object to a spare gallon of oil being brought in, but although a full tank of petrol may be brought into France free, any carried in a spare can is liable to duty and tax, but this would not amount to much for, say, a couple of gallons.

Any make and nationality of camera may be taken into France with the temporary import papers relating to the car, and no difficulty arises on return to England provided the British Customs are notified at the start that the camera is of foreign make. The Customs enter it up on the car's papers and take the number of the lens. It is then readmitted free.

French peasants in a vineyard of the Burgundy district.

Free admission into France is allowed for twelve plates or two roll films or film packs per person, although one or two more are seldom objected to. One camera and one small ciné camera are also admitted free provided these bear evident signs of use. All the usual sizes of films and plates are readily purchasable at standard rates.

Readers who intend taking advantage of this opportunity should communicate without delay with the Editor of *The Amateur Photographer*, who will accompany the party.

Reference is made elsewhere in this issue to the proposed arrangement to join up non-motoring readers of "The A.P." with those with cars who wish to participate and are not averse to accommodating a passenger or two who will share expenses.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, July 1st.

Leigh L.S.P.S. Worsley. (Bus, 6.30 p.m., Brook's.)
S. Suburban and Catford P.S. Dog Fight. Members only.
Stockport P.S. Competition, "Spring."

Thursday, July 2nd.

Bedford C.C. Old Warden.
Camberwell C.C. Open-Air Meeting. Peckham Park. G. A. Slight.
Hammersmith H.H.P.S. "The Colour of the Print." J. Ainger Hall.
N. Middlesex P.S. Competitions. Prints, General and Special Slides, etc.
Oldham P.S. One-man Show (Prints). F. W. Taylor.
Sinclair P.C. A Ramble in Surrey. A. H. Redman.

Friday, July 3rd.

King's Heath and D.P.S. Print Criticism. Springtime.
Sheffield P.S. (Portrait Group). Criticisms. Mr. Lovatt.

Saturday, July 4th.

Bath P.S. Limpley Stoke Hill to Midford. Major Noel Harbutt.
Beckenham P.S. Leith Hill district. D. E. Kimmins.
Bristol P.S. Royal Show, Ashton Park.
Bournemouth C.C. Outing to Badbury Rings.
Cripplegate P.S. Tugboat Outing. Tower Pier, 2.15 p.m. J. J. Butler.
Dennistoun C.C. "City Streets." J. MacRae.
L.C.C. Staff C.C. Norbury Park, Leatherhead. A. P. Rose.
Manchester A.P.S. "Manchester Evening Chronicle" Land Cruise to Harrogate.
Nottingham and Notts P.S. Harlaxton. W. C. Lodge.
Oldham Equitable P.S. Visit to Manchester Fire Station.
Sheffield P.S. Tinsley Canal. C. E. Hoyle.
Southampton C.C. Combined Outing with Portsmouth C.C. to Tichfield.

Saturday, July 4th (*contd.*).

Stafford P.S. Church Aston and Vauxhall. W. A. Lynch.
St. Helens C.C. Warrington. Mrs. W. Madeley.
Wimbledon C.C. Wimbledon to Weybridge.
Windlesham C.C. Outing by car to Whipsnade.

Sunday, July 5th.

N. Middlesex P.S. Outing to Hambleden and Wheeler End. Miss D. M. Woollons.
Norwood C.C. Ramble. Over the Hills by the River. Miss K. F. Shrimpton.
South London P.S. Car Excursion. P. S. Johnston.
York P.S. Whitby. Joint Excursion with Scarborough P.C.

Monday, July 6th.

Leeds C.C. Discussion. "Why I Specialise in Photography."
Oldham Equitable P.S. "Advance and Novice Print Competition, also Technique Competitions." W. Miller.
Walthamstow and D.P.S. Still Life.

Tuesday, July 7th.

Leicester and Leicestershire P.S. Portfolio of Pictures by M. O. Dell.
Rotherham P.S. "Preparation of Chloro-Bromide Prints for Exhibition." J. Crowther Cox.
Wood Green P.S. Annual Print Competition.

Wednesday, July 8th.

Blackburn and D.C.C. Mr. Waddington's Competition. Last day for entries.
Borough Polytechnic P.S. Demonstration Competition.
Reading C.C. Visit to Messrs. Johnson's Works at Hendon.
Southampton C.C. Outing to Shawford. Misses Jones and Stubbs.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXL.

Mr. W. T. DAWSON.

From information communicated to our Special Representative.

"MY interest in photography commenced when I joined the Liverpool Amateur Photographic Association a few years ago; and it was principally through seeing the exhibition pictures on the club walls by many eminent workers that I came to take up such work myself.

"I use a $3\frac{1}{2} \times 2\frac{1}{2}$ reflex with f/4.5 Tessar, and an N. & G. Special Sibyl of the same size with an f/4.5 Ross Xpres. My enlarging is done with apparatus of the horizontal condenser type.

"I do not specialise in any particular class of subject, preferring to have as wide an outlook as possible to obtain the greater pleasure to be derived from working at pictures in different styles. Consequently I have endeavoured to cultivate the habit of being constantly on the look-out for interesting pictorial effects of sunlight and shadow.

"In this way pictures are often seen; and if I have no camera with me a note is made so that a visit can be paid another day. 'Shadow of the Lamp' is an example. This exercise in observation and composition I have found most helpful.

"I consider it desirable from the exhibition point of view to keep my works reasonably simple in content, and to convey the subject strongly; also, as far as possible, composing the picture to fill practically the whole of the plate.

"In the way of negative material I use both plates and film packs, the former being mostly Ilford Soft Gradation Panchromatic, backed. Development is done by dish, but by tank when I have a large number, and all by time and temperature, which I have found most satisfactory. I commenced with Azol, and practically all my negative work has been done with this developer. I have, however, recently used Kodak D76 for special subjects, and have found it helpful in preserving the fine grain of the emulsion.

"Negatives are developed, as far as possible, to suit the contrast of the subject for use on normal and hard bromide paper with my condenser enlarger; but occasionally I use chlorobromide. Contact prints are first made, and those which show promise are enlarged to whole-plate size. These are carefully considered, and any necessary trimming or shading is decided; after which large prints are made for exhibition, these receiving minimum possible exposure and full development, the factorial method being used.

"The prints so produced are critically examined when dry, and if considered satisfactory are carefully spotted, unwanted high-lights subdued, and any shadow tones requiring extra strength which could not be secured by shading when enlarging are dealt with by one of the usual methods.

"To those who have not already done work for exhibition I would say that they must be prepared to concentrate, to work carefully on good lines, and to have plenty of patience. I would also strongly recommend them, in fact everyone interested in improving their photography, to join one of the photographic clubs, where they will find, as I did, experienced members ready and willing to help them.

"I cannot conclude without paying a tribute to the benefits I have derived from the many instructive articles in *The Amateur Photographer*, and particularly those dealing with composition, etc."

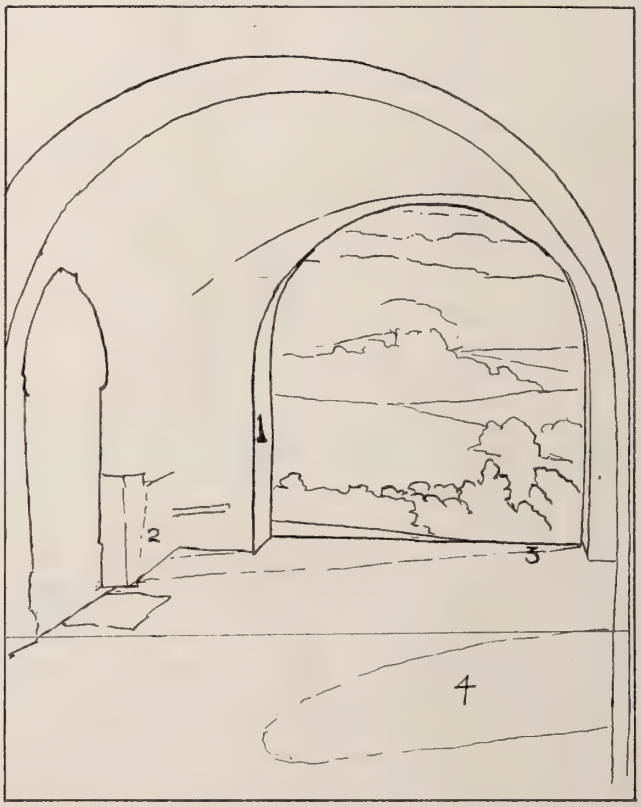
(A further example of Mr. Dawson's work is reproduced on one of the centre Art pages.)

SHADOW OF THE LAMP. *W. T. Dawson.*

Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"CORINTHIAN SUN," *by J. J. Rutgers.*



SIMPLE as this subject may be and unassuming as it is in its perfectly natural treatment, it gets across with its admirable expression of an effect of sunshine most successfully. This is rather remarkable in view of the restraint with which the lighter tones are employed, and, amongst other things, it is somewhat curiously attractive in that it is not upon the vista that the effect is displayed but upon the arch through which it is seen.

Insomuch, it is such a reversal of the usual order of things that it acquires an individualistic freshness of outlook that is most engaging; the value of the effect is enhanced, and it betrays a vision of more than ordinary sensitiveness.

The attention, naturally, is attracted, in the first instance, to the point (1), where the brightest light occurs, and the point in question becomes the centre of interest. The brilliance of the light is set forth and the importance of the position emphasised by the deeper tone with which it is surrounded, and its placing in the picture space—off the centre and well away from the edge—is strong and forceful. It dominates the scheme and does much to ensure that sense of unity which it is the function of composition to create.

There is, however, a subsidiary splash of light at (2). This extends the area affected by the sunshine and enhances the value of the effect, as well as acting as a supporting accent to (1). It does not compete with (1) as its scale is by far the lesser, and its placing, so much nearer the edge, is weaker. Its occurrence just where it falls may be more or less fortuitous, and, depending on the angle at which the light is falling, is scarcely under the control of the author. But it does so help the effect and aid the arrangement that he should be credited with the wisdom of selecting the moment when the light so fell for making his exposure, and, as far as this goes, he is undoubtedly responsible.

Its introduction on the left-hand side of (1) renders the inclusion of a point of light on the right-hand side advisable in order to create a proper sense of balance. A smaller point than (2) would do if it were placed somewhere about the vicinity of (3), but, as the way the light is falling causes a stretch of light to run from (3) to (2), the light at (3) is sufficient, chiefly because of the connection established between the points (1), (2), and (3).

Underneath this stretch of light, there is another patch at (4). If the long length of foreground be viewed as essential, its inclusion might possibly be regarded as justifiable, for it does diversify the tone values and prevent them from becoming monotonous, but, apart from this, it can only be regarded as a source of distraction. It has the effect of pulling away the attention which should rest on the stretch above, and, having this in mind, together with the fact that much of the nearer foreground could legitimately be regarded as superfluous, it really would seem wiser to trim it off altogether along the line indicated in the sketch.

The alteration changes the picture from a vertical to a horizontal, but there is no particular loss in that in comparison with the gain in cohesion and unity. Moreover, the subject seems to sit more comfortably in the picture space, and, indeed, does seem to be more suitably treated. The effect can easily be seen by masking the original up to the same level, and, on the whole, the revised arrangement will generally be preferred.

All the essentials of the subject lie above the line, and, if the shape be thought too square, a trifle—somewhere about three-eighths of an inch—could be taken from the top. This would also tend to equalise the balance of tone at top and bottom, and does not involve any vital sacrifice.

The beauty of the work, however, lies in its fine expression of an effect of mellow sunshine. It is exceedingly attractive, and, though a good deal of the softness is attributable to the choice of such a time when the sun was low in the heavens, not a little is due to the comparatively high key in which the adjoining shadow tones are rendered. The fact that the centre of interest and the effect at its brightest are coincident is also of moment, and the localisation of the two in the same vicinity enforces the effect despite the absence of violent contrast.

The whole thing is well conceived and admirably executed. Its craftsmanship is excellent and well demonstrated by the quality of the tones, and, above all, the choice of time for making the exposure was extremely well judged.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

"A CORNER IN HAWKSHEAD," by F. E. Potts—No. 1 of the prints reproduced on the opposite page—is a well-chosen subject, and the figures, if not quite so well isolated as they might be, are nicely placed and add a very judicious touch of human interest. The contrast of the subject, however, is considerably in excess of the normal, and, because steps have not been taken to correct it, a corresponding excess of contrast appears in the print.

Subject and Print.

As the print stands, the darks are about as deep as they can be. If printing were carried farther with the idea of getting more tone in the lighter portions, most of the darker tones, including those of the figures, would be lost in a general obscurity. The lights, as they now appear, are devoid of gradation, particularly in that bit of sunlit wall just above the heads of the figures, and the impression conveyed is one of harshness.

Assuming—as appears to be the case—that the time of development of the negative was normal for the normal subject, one method of making the required reduction in contrast—reducing the time—is not now available. Nor is it usually when a subject such as this is contained upon a roll of film that is all developed at once. If, however, the negative had been individually developed, as is easy to arrange with plates or cut film, the time should be cut down to somewhere about two-thirds of the normal.

Had that been done, and had the same grade of printing paper been employed, the present excess of contrast would have been avoided. But, as it was not, the present position is that the range of tone in the negative is too great for the capacity of the printing paper.

Range and Contrast.

It is like trying to fit a lid to a box that is too large for it. If one end is fitted, there is a gap at the other, and, if the other is put on first, the gap occurs at the opposite end. Here, the gap is at the lighter end of the scale, but, as previously pointed out, if they were fully printed, all the darks would be sunk. The thing is, in such circumstances, to choose a paper of longer range, i.e., one the contrast range of which equals that of the negative, or one of the type that is usually known as "soft."

Put in another way, if it should not be possible to correct excess of contrast in the subject by a reduction of the development time of the negative, or if, by any chance, a negative should be over-developed, it is possible, within wide limits, to correct the fault by the substitution of a softer type or grade of paper.

If, for example, the paper employed for the original of this print were a "vigorous" gaslight, the probability is that the grade described as "soft" would be sufficient to enable the darks to retain their present depth while permitting the printing of the lights to show the modicum of gradation that is essential. Incidentally, it may be mentioned that there is usually a "normal" grade available, the range of which is between "soft" and "vigorous," but it is doubtful if it would be of much use in a case like this.

Exposure Complications.

Turning to No. 2, "Idle Moments," by A. Broadhead, we find a similar excess of contrast, perhaps not quite so flagrant, but still in evidence. Here, the lighter tones are suitably recorded, but all the gradation there should be, particularly just behind the figure, is lost in utter blackness.

There is a strong probability that something of the fault is attributable to a certain amount of under-exposure. If so, it introduces a complication that cannot be countered by any after-treatment, so that if the depth of tone arises from this cause and there is no gradation in the negative, no alteration in the grade of printing paper can remedy the deficiency. Still, if it should be only partial, the substitution of a softer grade—normal should be adequate in this instance if vigorous was previously employed—would correct the tonal range and provide a more harmonious print.

No. 3, "Cottages at Dulverton," by G. T. Gabe, represents a much nearer approach to a proper rendering of its subject, though, perhaps, its range is not quite so extreme as the other two. There is more than a hint of tone, even in the sunlit sides of the chimneys, and, if the darks of windows and doorways are a little intense, their area is small, and they do not seem so assertive as the darks in No. 2.

A Matter of Opinion.

Whether it would be advisable or not to endeavour to obtain a softer rendering is a matter of opinion. A slightly softer grade of paper could be tried, but it would probably involve a little loss of vigour, and some might prefer the former effort.

It is a question of taste and the purpose for which the print is required. For exhibition, the present range would generally be considered preferable, and, for viewing in the hand, a good many people would like the softer version better. The effect has been very well seen and caught, and, from the technical standpoint, the print is appreciably the best on the page.

No. 4, "A Cornish Gate," by D. C. Bodenham, is just about right as far as the suitability of the printing paper for the negative is concerned, but it is somewhat overprinted and seems inclined to dullness in consequence.

A lighter print would show up the subject to better advantage, such as it is, but the motive is rather slight and the gate seems somewhat overlarge for the picture space.

Deficiencies in Printing.

No. 5, "In Peaceful Lane," by L. Handley, displays a more normal subject, but, if anything, the print is on the soft side and could do with a little greater vigour.

It also seems to show a measure of fog, but whether this is attributable to an unsafe light during development, or a too lengthy immersion in the mixture, or a combination of both, cannot now be stated with any degree of certainty. One or more of these possible causes is likely and it should not be difficult to determine which. At all events, it should be traced and eliminated, for it is a decided drawback and should never be allowed in a print that is submitted for competition.

The figures are well placed, but, unfortunately, betray a consciousness of the presence of the camera, and this, again, is a defect that should be carefully guarded against. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

A WORD ABOUT LIGHTING.

IT is a universally accepted fact that the lighting of any subject is a matter of the greatest importance. In the long series of articles by well-known makers of exhibition prints it is significant that so many of the authors have emphasised their liking for sunlight effects—the definite contrasts of light and shade. The sun is a powerful ally of the photographer in most of his work, and especially when the light is sufficiently unobscured to give definite shadows and brilliant high-lights.

In the studio, whether for portraiture or for commercial work, reliance on daylight is almost a thing of the past. Artificial lights of varying power, with their rays diffused or concentrated, are employed with great elaboration and skill; and the work turned out is largely dependent for its beauty and effect on the carefully-studied lighting. This has become an art in itself.

Out of doors, however, the photographer has no control over the lighting, He cannot command the sun to shine, nor to alter the direction of its rays. The most he can do is to watch and wait for favourable conditions, although he can certainly make the most of those conditions when they are present by careful choice of viewpoint. He can often by such means vary the proportions of sunlight and shadow, and arrange the juxtaposition of light against dark, or the reverse,

The three illustrations on this page I made to give a simple object-lesson on the differences that result merely from the direction of the light falling on the subject. This subject, by the way, is a Victorian lady's purse with ivory sides, the reproductions being about two-thirds the size of the original.

I would digress here to suggest to the beginner that he can occasionally do a useful bit of "home-work." It is far better to make a few actual experiments than only to read about them. They will often set his wits to work, to think out what to do, and how to contrive to do it.

Take my own little example. I put a spot or two of fish-glue on the plain side of the purse, pressed it down on a piece of black paper, and let it lie there while I got ready the camera and all the other necessaries. Then I pinned the paper on to a small stand, or easel, which I could turn at any angle to the light from a window. When I had finished, a little warm water removed both paper and glue, and the purse was none the worse when I gave it to a young lady whose grandmother, when *she* was young, might have had one like it.

In spite of the black paper the backgrounds of my prints were grey and patchy; so, for reproduction purposes I painted them over. I mention this while you can see the effect, so that you can remember it when I come to say something (perhaps next week) about the preparation I used for the purpose.

In Fig. 1 the purse was directly facing the light from the window, and the result is flat. There is practically

Fig. 1. *Fig. 2.* *Fig. 3.*

Fig. 4.

no form or relief in the carving. For Fig. 2 the easel was turned at an angle, and the difference made by the cast shadows is very evident. For Fig. 3 the exact angle was a matter of very careful adjustment. The light just "glances" over the surface. This has not only lengthened the shadows, but it has shown that the surface of the ivory is not flat, but very slightly concave. It is far more realistic than Fig. 1.

You may say that you do not want to photograph an ivory purse. Very likely; but the lesson the three prints teach has a very wide application. It holds good if you photograph people, flowers, landscapes, buildings—almost anything. The lighting of Fig. 1 is the worst for most subjects, but the only correct one if you want to copy a print. The lighting of Fig. 3 may be ideal for a host of subjects.

Fig. 4 would have been a good example for my recent remarks on "muddled" pictures. I took it while I was stalking a particularly mercurial and elusive cat in the corner of a garden. The lumber-shed is not beautiful, but the leaf shadows are. Even when the sun is shining it is only for a brief period that those shadows fall on the boards, and this point also has a very wide application in pictorial work.

Cast shadows are often of great pictorial value, and their position and character is naturally dependent on the direction of the light. The shadows of foliage are often made a feature of a picture, but they are nearly always at their best when they fall on a comparatively plain surface. I have seen them introduced in photographs of architectural subjects with elaborate detail, and the two kinds of detail compete and clash, and the result is "muddle." The muddle in Fig. 4, however, is not due to the shadows, but to the dreadful foreground stuff.

PARAFFIN WAX—A USEFUL MATERIAL FOR THE PHOTOGRAPHER

EVERYONE nowadays is familiar with the use of wax for proofing cartons, clothing, etc., and the usefulness of this commodity may well be brought to the notice of the amateur photographer.

An extremely thin coating of the wax to paper, for instance, will render it proof to the action of water and many chemicals such as are used by the brethren of the camera. Consequently, use should be made of it for the proofing of labels on bottles of developer, etc.

Most chemists and oil and colourmen stock it, or can easily obtain it in a short time, and it is preferable to use the fully refined grades, although in emergency the wax of a candle can be melted down for the purpose.

In coating labels a small quantity should be melted in a spoon over a small flame, but without letting the flame play directly on to the bottom of the spoon or the wax will become overheated. It is then poured over the label as thinly as possible, any surplus being wiped off. Do it over a piece of newspaper, and any that falls will convert the newspaper into a good fire-lighter.

Many of us like to make up our own developers in quantity for the sake of economy, and we are advised to fill the bottles to the brim, so that there is no air between the surface of the liquid and the base of the cork. Here a little paraffin wax will help in preserving the solutions. Just melt a little of the wax, and, inverting the bottle when the cork is inserted, dip it into the wax sufficiently to immerse the cork and leave a layer of it a quarter of an inch or so over the mouth of the bottle.

There are just those odd occasions when it is desired to make a large picture, but for one reason or another we do not feel justified in the outlay necessary to purchase the big dishes which are necessary. Here our friend wax is very useful indeed.

It is a simple matter for the average photographer to turn his hand to the making up of a shallow tray, the bottom of which can be a piece of plywood of the desired dimensions, and the sides pieces of batten. Attention should be paid to the fitting of the joints, so that when the wax is applied in a molten state as little as possible may ooze through.

Now melt a quantity of paraffin wax in a wide tin or an old saucepan—the material is quite harmless in its refined form—and apply it to the inside of the tray with a brush; or it may be swilled round in the tray and the surplus poured off. Particularly if the latter course is adopted it is as well to heat the tray so that the wax penetrates the wood and so gets a chance to "bind" firmly, otherwise if the wood be very cold the wax will set as it runs on and will tend to flake off when it is hard. Further, the better the penetration the better the proofing qualities.

If it is found that the surface is very rough when the wax has set it may be smoothed by applying a hot iron over it, which will help the wax to run, and it is as well to do this in any case, so as to be sure that the corners are thoroughly treated.

To table-top workers familiarity with the nature of a soft grade of wax will readily suggest innumerable ways in which it can be used for modelling. It can be moulded in the hands, and will "stay put" when a desired object is formed; it can be cut to shapes easily with a knife, and any cuttings or crumbs may be readily worked back into the bulk after use, either by working with the hands or by melting.

If, for this purpose, a wax of sufficient plasticity is not readily obtained, the admixture of a little jelly of the "Vaseline" type should effect the necessary end.

E. G. W. INGRAM.

Picture Points

No. 6 (New Series) *by RICARDO*

Reflections in Water.

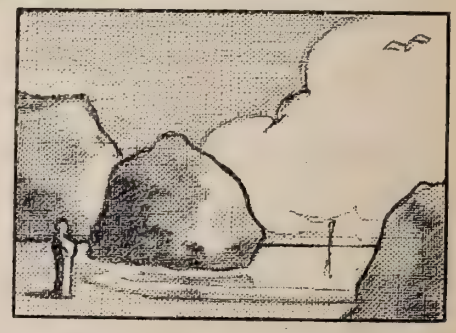
MANY a photographer has been beguiled by a subject with almost perfect reflections in placid water into making an exposure of what was thought to be a good picture because of the novelty. Because it is unusual it is attractive, but that does not necessarily constitute good composition or pictorialism. Immediately a subject is repeated in shape and tone so does the attention become divided between the original and its reflection. If a print can be turned upside down and still look much the same, then it is pictorially weak.

The lower sketch illustrates the mistake of allowing the reflections to compete with the bridge, as well as showing the common fault with beginners of allowing the bridge to cut the picture in half horizontally. By turning the camera upright and taking up a viewpoint to one end of the bridge, a better pictorial view might be possible, cutting down the reflections to a minimum and allowing the bridge to play only a part instead of dominating the whole of the picture.

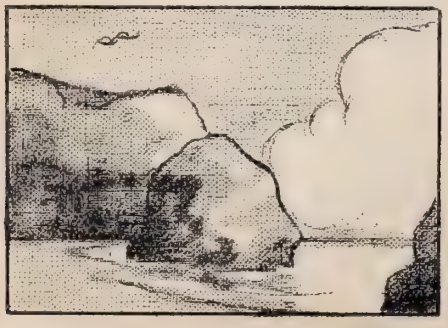
Foreground and Distance.

WHEN taking photographs of distant views it is often very helpful to include a strip of foreground at the base and, if possible, a figure or two. Not only does it give strength and a foundation to the composition of the picture, but it also helps to create the sensation of distance that is so often lacking in subjects of this character.

In the same way that we feel the effect of height by unconsciously comparing the various distant objects such as buildings, etc., with the immediate foreground, so can we re-create that feeling by including the ground at the base of the picture. If we also include some middle distance objects, such as some trees on the descending hillside, then the eye is led more gradually into the distance and we do not get so sudden a jump.



By comparing the two sketches of the same subject we can appreciate the advantage of including a "door-step" into the picture.



Another fault with the top picture is that it is shown divided into two, as if the photographer were undecided as to which was the more interesting half, the blue sky and cloud or the winding river and the fields.

While it is well known that a yellow filter helps to penetrate the haze and show more clearly the far-off details, it sometimes pays for pictorial work, to ignore these details and let the misty atmosphere help to suggest the distance.

A Few Hints on Rocky Coast Subjects.

ALTHOUGH a rocky coast can supply excellent material for a photographic subject, it requires considerable skill and experience to make it pleasing both technically and pictorially. From the technical point of view, the question of tone contrast can be largely overcome if a low lighting is used, such as early morning or late afternoon, in order to throw more light on to the face of the rocks and to relieve the heavy shadows that are sometimes too patchy and contrasty. A low lighting is also a very pleasant change to the usual high midday light, and often throws an entirely different outlook on to the scene.

Because of the heavy and solid nature of the rocks, they must also be treated with great care as far as balance is concerned. It is not pleasing to see a few rocks scattered here and there and left unsupported by a light foreground which, although might be exactly as seen, is weak, pictorially.

In the left-hand sketch a few faults that are frequent in beginners' snaps have been made and are remedied in the right-hand sketch. The rock in the middle distance is too central in the picture space, and there seems to be no separation between it and the distant rocks. The rock on the extreme right is too small and lacking in shape, although it could be helpful in restoring balance. The foreground is very weak, and does not give sufficient support to the general arrangement. There is also no idea of the size of the rocks, and here a figure or boat is best introduced to give scale or proportion. Notice the change made in the viewpoint.

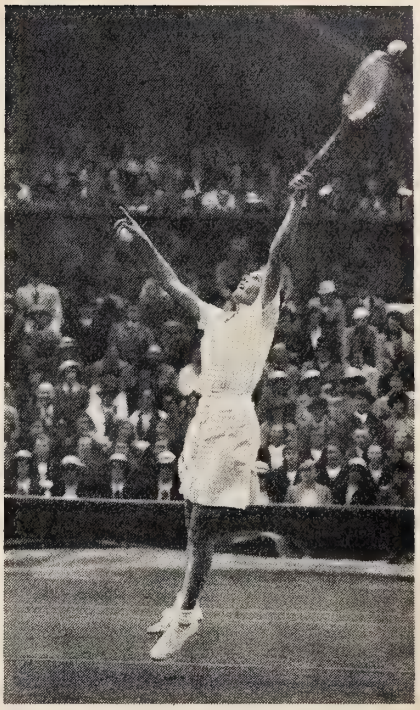
THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

PHOTOGRAPHY *at the* Wimbledon Tennis Championships

By GEOFFREY CLAYTON, an Umpire at the Championships since 1931.

OF the thousands of tennis enthusiasts who daily flock to the All-England Club grounds during the course of the Wimbledon Championships, which close on Saturday next, many have been taking their cameras and wondering, perhaps, how to use them to the best advantage.

The best seats, from the photographer's point of view, on the centre court are the 6s. "ringside" seats *on the same side as the umpire's chair*—i.e., on the left-hand side with one's back towards the clubhouse; and the same applies to the reserved seats on No. 1 Court. From this position the best close-ups can be obtained, with the sun always at one's back. Most of the best matches, particularly in the later stages of the meeting, naturally take place on these two courts. If possible, try to avoid obtaining a seat which is in a direct line with the net, a service- or a base-line, otherwise your view may be obstructed by the umpire or one of the linesmen.



For those who must work from the free seats at the opposite sides of these two courts, a really efficient lens hood should form an integral part of the equipment.

Bear in mind that, with the exception of the Centre and Court 1, all photographs will have to be taken more or less across the court; and even on these two "star" courts the down-the-court seats are sufficiently far away to call for the best in apparatus if satisfactory results are to be hoped for.

For those whose tennis experience is insufficient for them to be able to anticipate the probable movements of players, it might be well to bear in mind that, in a singles match, a competitor remains reasonably motionless on preparing to *receive* service, and in a doubles, the two players at the net do not, as a rule, move while their two partners are engaged in serving or receiving. Tennis players with a good knowledge of the game and rapid shutter equipment will, however, be able to obtain some magnificent action shots from the ring-side seats.

Remember that many of your favourites can be seen at quite close quarters on the outer courts. A little anticipation and patience, coupled with a study of the day's programme as published in your newspaper, will enable you to take up an advantageous position on a chosen court in advance of the crowd. As before, always work if possible from the side on which the umpire's chair is situated.

Strictly speaking, no spectator is allowed upon any courts; but, provided the crowd is not too large, a tactful "Would you mind, please?" *before* the beginning of a match will rarely fail to obtain a momentary pose on an outer court. But this must be done *immediately* the competitors enter the court, and everything must be ready—no dithering about with focussing or setting the shutter. It is definitely not a popular act to request competitors, and particularly ladies, to pose after a gruelling match on a sweltering day.

Miss Kay Stammers in action at Wimbledon

Just one hint, particularly to users of movie cameras. Always employ such apparatus with tact and make yourself as little obvious as possible. In games like the Wimbledon championships, competitors are strung to a very high pitch of tension; and an umpire is quite within his rights to order a photographer to desist if he decides that the use of a camera is disturbing anybody upon the courts. I am a keen photographer myself, but in this matter my sympathies are definitely with the players.

Finally, remember that there are many characteristic Wimbledon pictures to be made other than merely those of the play itself. The crowds, the ball-boys, the umpires even, provide many an amusing incident and the chance of picking up a news-snap is ever present. In addition, magnificent views of the entire grounds, together with many interesting "angle shots," may be obtained from the terraces, open to everybody, which surround the Centre and No. 1 courts.

An interesting shot of the crowd on the Centre Court at Wimbledon.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

CARRYING CAMERA ON CYCLE.

SIR,—With regard to a recent enquiry by a reader on the subject of carrying a camera on a cycle, may I say that I have found forward pannier bags, such as are supplied by Camp and Sports Co-operators, Ltd., 1, Newgate Street, E.C.1 (usual disclaimer), most effective. The two bags simply hang either side of the top tube of the cycle, and are secured by a single strap round the steering-head. The camera and accessories are placed in one bag, with a large rubber sponge or heavy focussing-cloth to act as shock absorber, and tools and wet-weather kit in the other bag, while the tripod is strapped across the back of the saddle. The bags are just large enough to accommodate a quarter-plate Sanderson and a thick cloth, and I have carried one many hundreds of miles thus without injury, even over really rough Highland roads. The whole secret is to see that the padding with the cloth is so arranged that the camera does not come at any point into direct contact with the cycle-frame.—Yours, etc., R. O. FAULKNER.

FILMS OBTAINABLE IN GERMANY.

SIR,—Your correspondent, H. J. A. (Cambridge), who enquires what kinds of film he will be able to obtain in Germany, may be interested to know that Kodak and " Verichrome " are on sale in all the larger towns at approximately the same prices as those charged in this country.

Of the " native " varieties, Agfa is obtainable everywhere (even in railway station buffets !) and is identical in all grades with that sold in England. Perutz, ortho. and pan., and Zeiss Ikon Pernox are also obtainable and I have had some very good results with a super-speed double-coated orthochromatic film bearing the name " Herzog," which I have not seen over here.

Wishing your correspondent a very happy holiday in " Heaven's own country for photographers."—Yours, etc.,
GRAHAM P. GODDARD.

DEVELOPING ROLL FILM.

SIR,—I think Mr. R. E. Burnett, whose letter describing his method appears in your issue of June 10th, would find it more easily carried out by using an Ensign Trident. This admirable and simple gadget is a heavy porcelain three-pronged affair which fits into a quarter-plate dish. With 2 to 4 oz. of solution in the dish, the film, drawn to and fro emulsion side downwards underneath the central prong with ease and certainty, is always in the developer. It is easier still, and far more likely to result in an undamaged film and untired arms, if one uses the new 4-exposure $3\frac{1}{4} \times 2\frac{1}{4}$ rolls (or 6-exposure for the $2\frac{1}{4} \times 2\frac{1}{4}$ size, which I favour). These short films are a pleasure to develop, and after years of messing about with plates, tanks, and daylight film tanks I am at last getting a really high percentage of negatives with no spots at all, even when examined by translucence with high-power glasses on. I can never be persuaded that to shut a rolled-up film into a tank, either with or without paper and apron, and expect it to develop properly, is either a scientific or even a common-sense procedure.—Yours, etc., H. S. GASKELL, M.B.

HOME-MADE LIGHT FILTERS.

SIR,—All readers of " The A.P." know the advantages to be gained by the use of a light filter, but many readers of limited means like myself know of the expense incurred by experimenting with these almost essential accessories. This expense may be obviated by making one's own light-filters.

The procedure is very simple and wide scope is left for experiment by varying the density and colour.

A 25 per cent solution of ordinary powdered gelatine is made and filtered through blotting-paper ; this operation is greatly simplified if boiling water is used. The amount of gelatine solution depends on the number and size of the filters to be made. This is divided up into several lots in test-tubes or similar receptacles.

Filtered solutions of some suitable dyes are next made—I use leather stains dissolved in boiling water—the concentration of the dye depending on the density of the filter required. A little of the dye is added to some of the gelatine, the proportions of dye and gelatine adjusted until the required density is obtained. This may be ascertained by brushing some of the mixture on glass and looking at it by transmitted light.

When a suitable mixture is obtained a piece of clean glass is flooded with the warmed mixture (an old lantern plate from which the emulsion has been removed), and the whole is then set away to dry. When the gelatine has toughened, i.e., in about ten minutes, the slide is slid carefully, gelatine side up, into a 10 per cent solution of formalin and left for five minutes.

The slide is removed and left to dry in a dustproof atmosphere on its end like a lantern plate, and the job completed by affixing a cover-glass for protection. A clip for mounting on the camera can be made out of tin-plate black lacquered. The factors of these filters have to be found by experiment, keeping in mind the fact that it is always best to over-expose.

I have taken several photographs through my set of these filters and find them excellent.—Yours, etc., P. A. PEACH.

METOL POISONING, ETC.

SIR,—I would like to suggest to J. A. E. (London), *re* metol poisoning, that the skin trouble he suffers from when developing may be due to the acid fixing bath. The symptoms of this form of skin trouble are whitening of the skin followed by slight peeling. The skin afterwards becomes red and sore, dry, and sometimes cracks, when slight bleeding follows. Irritation is acute. I have been attacked on more than one occasion when using hypo and potassium metabisulphite. The skin between forefinger and thumb is the first place where the trouble appears, as after fixing operations one usually holds up the print or plate for examination, letting the solution run downwards from the finger-tips, which quickly dries on the skin.

As J. A. E. uses rubber gloves for developing, it is possible he removes them, not suspecting that the fixing bath is probably the source of the trouble.—Yours, etc., V. CORELLI.

THE HANDYMAN AGAIN.

SIR,—A little while ago I was unfortunate or clumsy enough to break the outer shell of my $3\frac{1}{4} \times 2\frac{1}{4}$ Correx tank. A repair was, however, effected in the following manner: The tank was found to be a tight fit in a large-size Ovaltine tin. The bottom of a tin was therefore cut off to give an inch or so more in height than the height to which the tank was damaged, i.e., the tank was damaged to a height of about 1 in. from the bottom, and the tin was therefore cut round 2 in. from the bottom. It was then warmed up to a heat insufficient to melt the solder, but sufficient to ensure that a little pitch, which was melted and run into it, would remain soft long enough for the tank to be got well into position. The warming of the tin also had the effect of enlarging it sufficiently for the tank to go into it fairly easily, while as it cooled it contracted and held everything firmly in place. The broken tank with its pieces carefully assembled was then pressed firmly but gently into place, and after the tin had been painted black the repair was complete and has proved quite satisfactory in use.—Yours, etc., H. M. SHEPPARD.

A MAKESHIFT SHUTTER RELEASE.

SIR,—I am the owner of an Ensign roll-film reflex camera. One afternoon recently I set out to take some photographs quite near my home, and I did not carry the camera in its case as I usually do. Imagine my surprise when I found that the small shutter release knob was missing. (This is a little plunger with a shouldered end, screwed, which screws into the camera, and can be substituted for a flexible cable release when needed.)

I hurriedly felt through my pockets for a temporary substitute, and, being a golfer, I discovered a " tee " among my assortment of curios. This fitted exactly, and being made of wood it screwed into the camera firmly. The top, which is hollowed out for the ball, is just ideal for the finger-tips, and I got my photographs taken with very good results. I shout " Golf Tee Saved a Life." Now I never go out without one or two in my pocket in case I have the same experience again. (This knob is rather a weak part of an otherwise first-class camera.) Trusting that this experience of mine will benefit quite a few of my brother photographers.—Yours, etc.,
DAVID HODGHTON.

A GLANCE INTO THE DARK AGES

This week we sold our 5,000th miniature camera, thus marking something of a milestone in the history of our business. On the strength of this achievement, we feel stimulated to recapitulate a little.

Approximately ten years ago the pioneer Leica cameras began to find their way into this country, to be received with suspicion and reserve. Our first Leica was the model fitted with the Compur shutter. We used this camera on a holiday in Eastern Europe, and were greatly impressed by its handiness and precision. Previously our personal equipment had comprised a quarter-plate folding reflex. We kept both outfits on for a time, but the big fellow was neglected from that date.

It was early in 1932 with the introduction of the Leica Model II, with its coupled range-finder, that miniature photography really went ahead to win. Our shelves began to sag with the old-fashioned outfits that were being thrown on the market by the hundred. Miniature camera production was too slow for the demand, and a new technique of miniature photography was somewhat gropingly being evolved.

In 1933, to meet a really crying need for a specialist type of service, we became miniature camera specialists, at first remaining in our extremely modest suburban premises, and then, in 1935 (our fame having gone abroad), moving into our present address in High Holborn. Here we held the first Contax exhibition. In this year, 1936, in the endeavour to set a new standard in Leica and Contax processing, we started our "Miniature Only" developing service. Needless to say that in the future we intend to remain, as in the past, at the forefront of miniature camera development.

THE FOLLOWING LIST REPRESENTS A SELECTION OF USED MINIATURE CAMERAS FROM OUR STOCK. WE HAVE, BESIDES THESE, THE MOST COMPREHENSIVE COLLECTION OF NEW MINIATURE CAMERAS AND ACCESSORIES TO BE FOUND IN GREAT BRITAIN. OVER FIVE HUNDRED DIFFERENT ACCESSORIES FOR THE LEICA CAMERA ONLY ARE TO BE SEEN AT OUR SHOWROOMS

WITH EACH OF THE SECOND-HAND CAMERAS LISTED BELOW WE GIVE A WRITTEN GUARANTEE OF MECHANICAL AND OPTICAL PERFECTION.

LEICAS :

Leica Model IIIa, fitted latest pattern rectilinear focussing f/1.9 Hektor. Unsoiled in any way.....£45 0 0
Leica Model IIIa, f/2 Summar lens, ever-ready case. As new.....£34 10 0
Leica Model III, chromium, f/2 Summar lens, ever-ready case. As new....£31 10 0
Leica Model III, black, f/2 Summar lens, ever-ready case. Excellent condition £30 10 0
Leica Model II, black, f/2 Summar lens. As new.....£27 15 0
Leica Model II, black, f/2.5 Hektor lens. As new.....£22 10 0
Leica Model II, black, f/3.5 Elmar, ever-ready case. As new.....£19 10 0
Leica Standard Model, f/3.5 Elmar lens, ever-ready case. As new.....£11 17 6
Leica Model I, f/3.5 Elmar lens, non-interchangeable. Good condition....£8 5 0
Leitz 3.5-cm. f/3.5 Elmar, chromium £6 15 0
Leitz 7.3-cm. f/1.9 Hektor, coupled (non-rectilinear). Excellent condition..£18 10 0
Leitz 7.3-cm. f/1.9 Hektor, coupled, rectilinear focussing. As new.....£21 0 0
Leitz 13.5-cm. f/4.5 Elmar Lens, coupled. As new.....£11 17 6
Leitz 13.5-cm. f/4.5 Elmar Lens, uncoupled. Good condition.....£7 5 0
Leitz 13.5-cm. f/4.5 Hektor Lens, coupled. As new.....£13 10 0
15-cm. f/2.3 Astro Identoscope Telephoto Lens, for Leica, with magnifier and reflex attachment. Listed £95. As new.....£67 10 0

CONTAXES :

Contax Model I, wedge-type range-finder, f/1.5 Sonnar lens, ever-ready case. As new £42 10 0
Contax, as above, but with f/2 Sonnar lens.....£32 17 6
Contax, as above, but with f/2.8 Tessar lens.....£25 17 6
Contax, as above, but with f/3.5 Tessar lens.....£23 17 6
(We can supply the Contax Model I with the improved slow-speeds shutter, but the earlier type range-finder, at a reduction of £3 10s. on each of the above prices.)
Zeiss 18-cm. f/6.3 Tele-Tessar, for Contax. As new £20 10 0
Zeiss 12-in. f/8 Tele-Tessar, with filter and special case. Cost £48. As new £30 0 0
Zeiss 13.5-cm. f/4 Sonnar, for Contax. Excellent condition £16 15 0

EXAKTAS :

Multispeed Exakta, f/2.9 Dallmeyer Pentac lens, case. Good condition....£17 15 0
Model A Exakta, f/2.8 Tessar lens, case. Good condition.....£17 15 0
Model A Exakta, f/3.5 Tessar lens, case. As new.....£13 17 6
Model A Exakta, f/3.5 Exaktar lens, case. Good condition £11 10 0

MISCELLANEOUS :

Contaflex, f/2 Sonnar, ever-ready case. As new.....£55 0 0
Automatic Rolleiflex, 6×6, f/3.8 Tessar, ever-ready case. Excellent condition £16 15 0

MISCELLANEOUS—contd.

Voigtlander Superb, f/3.5 Skopar, case. As new.....£11 17 6
Rolleicord, f/3.8 Triotar lens, ever-ready case. As new.....£11 17 6
Rolleicord, f/4.5 Triotar, case. As new.....£8 15 0
Foth-Flex 6×6 cm., latest slow-speeds model, f/3.5 lens. As new.....£7 17 6
Zeiss Super Ikonta, 530/16, f/3.5 Tessar, Rapid Compur. As new.....£19 17 6
Zeiss Super Ikonta, 530/LCPR, f/3.5 Tessar, Rapid Compur, ever-ready case. As new £14 17 6
Planovista, V.P. size, f/2.7 Macro-Plasmat. As new.....£11 15 0
Planovista, f/3.5 Trioplan. As new.....£8 17 6
Rubyette, f/4.5 Dallmeyer, roll-film adapter and 3 slides. As new.....£9 17 6
Zeiss Ikonta 520, f/3.5 Tessar, Compur. As new.....£8 7 6
Kodak Nagel Six-20 Duo, f/3.5 Kodak lens, Compur shutter, 2 filters and case. As new £7 17 6
Nagel Rolloroy, f/2 Xenon lens, case. Good condition.....£12 10 0
Kodak Pupille, f/3.5 Xenar, special reflex attachment. Good condition....£9 15 0

MINIATURE ENLARGERS :

Leitz Valoy Enlarger, latest type. As new.....£7 15 0
Praxidos, latest model for Contax with condenser and automatic focussing £9 15 0
V.N., semi-automatic focussing for 3½×2½ negatives (adapter for Leica size), f/4.5 Dallmeyer lens. Excellent condition.....£6 15 0
Ensign Miniature Magnaprint, fitted f/4.5 Dallmeyer lens. As new.....£5 0 0
Certos Enlarger for Leica negatives. As new. In case.....£6 7 6
Foth Enlarger, taking up to 4×4 negatives, f/3.5 lens. Shop-soiled only....£5 17 6
Dremograph Enlarger, takes Leica or Contax lenses. Shop-soiled only..£4 10 0
Contax Magniphot Enlarger. Good condition.....£6 15 0
Zeiss Miraphot Enlarger, 3½×2½, fitted f/4.5 Tessar lens. As new.....£7 5 0

EXPOSURE METERS (all as new)

Prinsen Meters, £2 5 0; Latest Pattern (Model 650) Weston Meters (Universal or Leica), £4 7 6 each; Old Circular Model Leicameters, Model 617, 37/6 each; Model 627 (Leica or Universal), £3 3 0; Photoskop Meters, 37/6 each.

NEW BOOKS AND ACCESSORIES :

The New Exakta Handbook. Price 3s. 6d., postage 2d.
"Home Portraiture with the Miniature Camera," by "Minicam".....3s. 6d.
"A Leica Amateurs Picture Book," by Rudolf Pestalozzi.....21s. 0d.
De Luxe Ever-ready Cases for Leica cameras in finest pigskin; price for cameras with f/3.5 lenses, 27s. 0d.; with f/2 lenses.....28s. 0d.
De Luxe Ever-ready Cases for Exakta cameras, best hide (obtainable only from us). (Please state whether ordinary or plate-back model).....27s. 6d.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Filming at the Bathing Pool

By P. H. BRAITHWAITE.

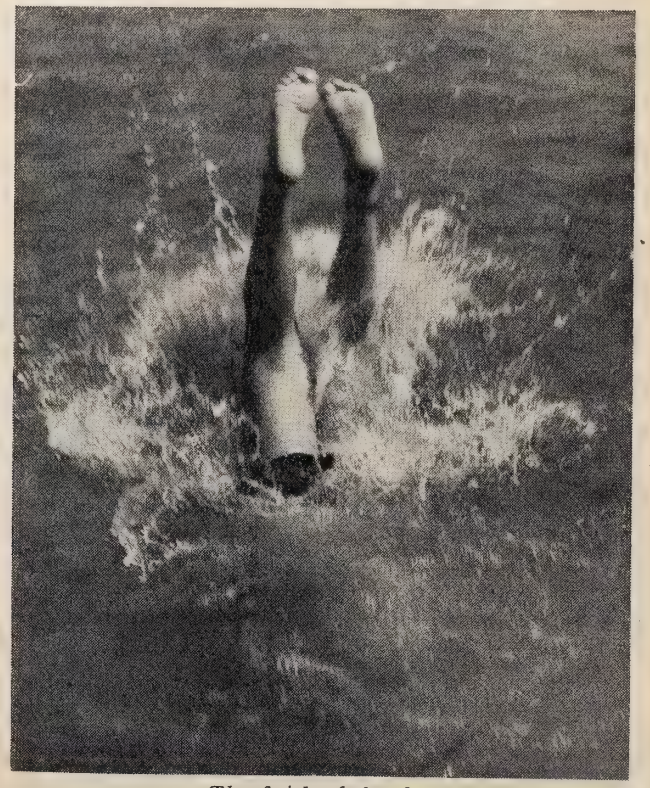
OPEN-AIR bathing pools, of which there are now a considerable number, are, with the arrival of warmer days, being utilised to their fullest extent. Aquatic sports provide the amateur cinematographer with opportunities which afford him excellent action material for his camera.

The swimming pool, on a sunny day, presents a most animated scene, and from the terraces usually reserved for non-swimmers suitable views of the pool and bathers are available. A considerable variety of shots can be had from numerous angles which make a pleasing compact film subject in itself.

The beginning of the shot.

Perhaps high-diving presents the best and most interesting of angles obtainable. Graceful divers give a beautiful picture, besides enabling the cinematographer to exercise his skill in successfully "panning" his camera. Choose a point well below the diving-board, preferably at water level, which enables an unobstructed view of the diver from the time he or she takes off to the time the water is entered. Preferably, the diver should be filmed against an open sky.

The angular viewpoint obtained from below gives an imposing picture as he dives off, and a careful "pan" will enable his progress to be followed until he splashes into the water.



Another interesting shot can be obtained from the diving-board itself, by filming from behind the diver as he leaves. There are numerous other shots obtainable, such as diving from the lower end of the pool, the children using the water-chute, and a shot or two of the sun-bathers relaxing. Water polo and aquatic gala performances offer unique opportunities for the amateur to obtain successful action pictures, and full advantage should be taken of these.

With quick-action shots, such as the high dive, care will be necessary in correctly "panning" the camera to cover the swift movement of the diver. Secure beforehand a good position where freedom of action for the manipulation of the camera is possible. During the diver's progress, keep him well in the centre of the view-finder, and include the consequent splash in the water.

Correct lens stops will naturally depend upon the time of day and weather conditions. Should the sun be shining, care must be exercised in seeing that no light reflection from the water enters the camera lens. A lens hood may be found a necessity to obviate stray sun-sparkle on the water.

Overhead shots, taken from an elevated position, of bathers gracefully swimming from one end of the pool to the other, form an attractive subject worthy of filming. The water should, of course, have the sun playing on it to penetrate its surface, when, from a high position, it is possible to film under-water swimming with good effect.

Whether at the seaside or at one of the many inland bathing pools, excellent diving shots are possible which form a most interesting inclusion to the holiday record.

The finish of the shot.

Making a Running Commentary for use with 9-mm. Ciné Film

By E. A. ANDERSON.

THE wonderful automatic machines of Messrs. Voice Records Ltd., now installed in most large towns, which record your voice and deliver a record which plays for one minute, render it possible for the owner of a radio-gramophone, in addition to a Pathéscope 9-mm. projector, to make a running commentary for his holiday films at very little expense. The records cost sixpence each, and the faithful reproduction of the speaker's voice leaves very little to be desired.

It will be agreed that a succession of titles in a holiday picture seems a little out of date in these days of talking pictures. A commentary on the picture, in the voice of the producer himself, will make the finished result exceedingly attractive.

In the case of a holiday film of, say, 300 ft., one super reel in length, it is quite possible, using these records, though perhaps not desirable, to make a running commentary for the whole film.

The writer prefers to make use of titles for part of the reel, and a commentary for the parts where it would seem more suitable.

Preparing the Commentary.

If it is particularly desired to avoid the loss of continuity in the picture, occasioned by the rather protracted time occupied in the changing of a record, and the insertion in the picture of a somewhat unnecessary title, to enable the change to be made, an alternative way of using the records would be to use one or two—two will be sufficient—to be played during the projection of the main title, when a few well-chosen remarks can be introduced, and will save those long titles which are somewhat difficult to construct with the sub-standard sizes.

Join up your shots in the order in which you wish them to be projected on the screen, in the ordinary way, minus titles.

Project the film on the screen, at normal speed, and decide which parts you wish to accompany with a commentary, and where you wish to insert titles.

Run the film through the projector again, and actually rehearse your chosen description of the shots you have decided to accompany with speech. Remember you have one minute to speak, and you must find out exactly how much film your voice can accompany *when the projector is running at normal speed.* You can say about 125 words in one minute, but obviously this would appear rather quick fire for our purpose, and rather fewer words will be desirable.

It will of course be realised that in the case of a spoken commentary there is no question of actual synchronisation of voice and picture, the only thing you must be sure of is that you can actually say in one minute what you wish to describe as appearing on the screen in the same period of time.

Having noted the frame at which you started speaking, insert a title immediately in front of it and, to save film, notch it once or twice, or more, but allow ample time to enable you to put a record on your gramophone before the familiar "click" indicates that the film is starting to move again. If you wish to carry on speaking for another minute, you will have to note the frame at which your first record finishes and insert another title—again notching it to allow time to change the record.

Making the Records.

Write down exactly what you wish to record, using a separate piece of paper for each record. You are now ready to visit the microphone.

The recording machine is entirely automatic. You put sixpence in the slot, depress a lever and a pointer moves slowly to START. *Immediately* it arrives at this position you must commence speaking, and if you have timed yourself correctly in your rehearsals, you should just complete speaking when the pointer arrives at FINISH.

Do not speak too close to the microphone, about four inches away is about right, and *speak a little to the side of it.* What you most require is clear-cut speech in the finished records.

Bringing your records home you will probably experience the thrill of having made your first record, but a bigger thrill awaits you—you have made your first talkie.

Projecting Picture with Commentary.

If possible, place your loudspeaker immediately behind the screen.

A small electric torch is essential, to enable you to attend to gramophone in the darkened room.

Place your records in numbered envelopes corresponding to the order in which they accompany your shots to be projected on the screen. CAUTION: Make sure that the records are the right side up. The right side is the side with "Voice Records" printed on it. The other side plays an advertisement for a popular brand of cigarettes, and if played accidentally may appear very humorous to your audience, but will be exceedingly annoying to you.

Fibre needles must be used with these records. Have a good supply easily available which you have previously tested, as they vary greatly.

Make sure that your projector motor is working at normal speed, and set gramophone speed at 78.

Immediately the last "click" of the projector indicates that the title preceding the part of the film you have made a record accompaniment for is about to disappear, place needle at commencement of record, and you have the finished result—talking pictures with 9-mm. film.

Reversal Film Exposures

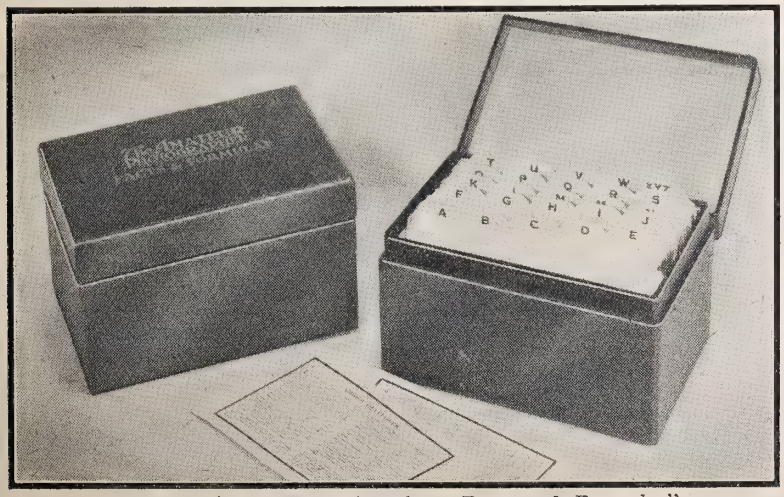
By LESLIE SANSOM.

THE attainment of perfect technique commences with the exposure of the film, for it is useless to expect a well-graded positive when the exposure is decided by guess-work. Correct exposure is more important with reversal film than with any other form of sensitive material. Especially is this so when using stock of the super-pan. reversal type, where a faulty exposure will completely neutralise the advantages of panchromatic material.

The increasing popularity of the wide-aperture lens makes the judging of exposures increasingly difficult. When using a lens of the "one-point-five" variety in the evening, with light of uncertain actinic value, the only way to determine the correct exposure is by actually testing the strength of the light. This can be done by using one of the many photo-electric cell exposure meters now on the market. These wonderful instruments completely cut out guess-work, and perfect exposures are obtained even when filming in the uncertain light that is found in such places as theatres, indoor swimming-pools, floodlit buildings, and similar scenes, where it is impossible to determine the exact amount of light that is falling upon the subject.

A habit should be made of periodically cleaning all lenses. The components should be unscrewed and carefully cleaned with an old, well-washed handkerchief, and finished with a piece of chamois leather, such as is used for cleaning spectacles. When the lens is being put together, use a small spotting-brush to remove all dust from the inside of the mounting. Apart from the flat image given by a dirty or misty lens, a certain amount of light is prevented from reaching the film, which materially affects the exposure.

When using a colour filter, it must be remembered that a different multiplying factor will be required for the same filter when using orthochromatic and panchromatic film stock, and also when taking in sunlight and artificial lighting. A great deal of time and money is expended by the manufacturers of film in determining the exact increase in exposure required for a given make of filter, and it is worth while to write to the makers of the stock in use, for their advice on the exposure required for the various makes of colour filters.



FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer is given under this heading in every issue. They are printed in the vertical form shown here, or horizontal, and each is complete in itself.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 × 3, supplied for card index cabinets.

The collection when completed will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

Special " A.P." filing cabinets for this card index are now ready. The illustration below shows their appearance. The size of the box is $5\frac{1}{2} \times 3\frac{1}{2} \times 3$ and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the " Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, S.E.1. Price 2s. 6d.

" The A.P." Filing Cabinet for " Facts and Formulæ."

13.

HYPERFOCAL DISTANCE

FOR every focal length of lens and for every aperture, there is a certain distance beyond which everything is in sharp focus. This distance is called the hyperfocal distance.

To calculate this distance it is necessary to know—the focal length, in inches, of lens (F); the circle of confusion desired in the negative (C); the f/ number in use of lens (f).

The formula for calculating the hyperfocal distance (H.D.) :—

$$\frac{F^2 \times C}{f \times 12 \times 3} = \text{H.D. (in yards).}$$

EXAMPLE.—For a lens of f/4.5 aperture of 5-in. focal length to give a circle of confusion of 1/200th in. diameter

$$\frac{5^2 \times 200}{4.5 \times 12 \times 3} = \frac{25 \times 200}{4.5 \times 36} = 31 \text{ yards.}$$

It should be noted that the circle of confusion (1/200th in.) is regarded as 200.

The greater the print enlargement desired the smaller the circle of confusion should be. Based on the fact that a circle of confusion of 1/100th in. diameter viewed at 12 in. distance is seen as a sharp point, it is usual to divide the focal length of the lens into 12 in. and to divide 1/100th in. by the quotient. Thus a 2-in. lens should have a circle of confusion of 1/100th in. ÷ (12 ÷ 2) = 1/600th in.

If the focussing scale is set to " infinity," then everything beyond the hyperfocal distance will be in sharp focus. If the scale is set to the hyperfocal distance, then everything beyond half that distance will be in sharp focus.

when the negative emulsion is soft when handled, the only remedy is in the skilful retouching of the negative.

Enlarger Lamp.

Can you advise me what to do with my condenser enlarger lamp which projects the shape of the wire filament on to the bromide through the negative? What is the best power of lamp to use with an enlarger of this kind?
C. L. (N. Shields.)

You do not say whether you use a clear glass or a pearl lamp. We certainly advise the latter and usually this remedies the trouble. If then, it is not entirely removed, use a ground glass as a diffuser, placed on the lamp side of the condenser. Knowing nothing about your enlarger we cannot be more definite about the lamp, but we should think a 60-watt lamp would be best for all-round work, although a 100-watt lamp would be advisable if the diffuser absorbs much of the light, or if slow paper or small lens stops are being used.

Photographic Societies.

Will you please furnish me with the names and addresses of the clubs in Liverpool?
J. W. (Liverpool.)

Your nearest photographic society is the Liverpool Amateur Photographic Association, the Secretary being Mr. A. C. Hughes, Bluecoat Chambers, School Lane, Liverpool, who will be pleased to furnish you with full particulars. The next nearest appears to be the St. Helens Camera Club, of which the Secretary is Mr. G. A. Forman, 206, Hard Lane, St. Helens.

another minute you will have to note the for exposure of bromide prints, and, if you find an exposure is between 8 and 16 seconds, you could safely give 12. On the other hand, there is no reason at all why you should not use an arithmetical progression, such as 5, 10, 15, 20, 25, 30, etc., for your trial strips, provided that you have first some vague idea as to the correct exposures. Otherwise it is better to use the geometrical progression system as 2, 4, 8, 16, 32, 64, etc., in order to cover a wide range. Should the exposure lie between 32 and 64 seconds, then it would be necessary to make another test strip beginning at 32 seconds and finishing at 64 seconds, and exposures in the order of 32, 40, 48, 56 and 64 seconds should be ideal.

Wide-angle Lens on Reflex.

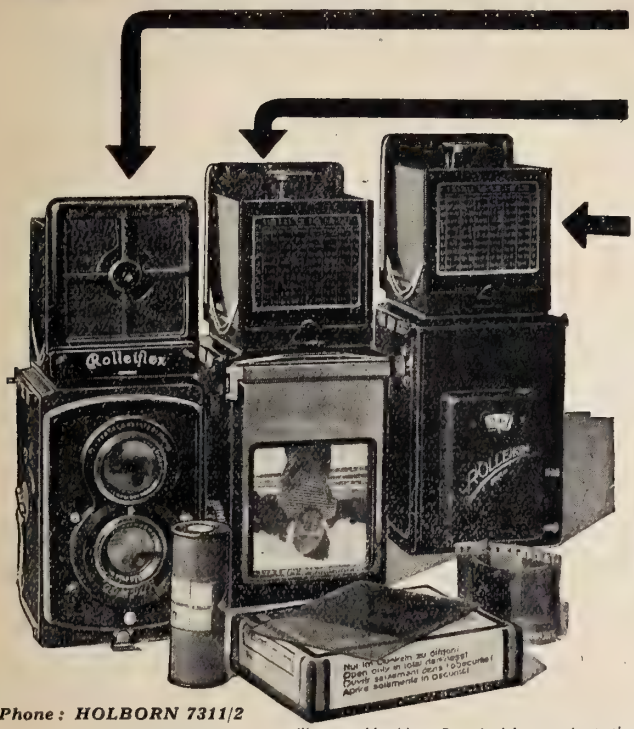
What are the difficulties in using a wide-angle lens on a reflex camera? J. F. (Birmingham.)

If the lens is so short in focal length that the mirror fouls the back of the lens when about to be raised to make the exposure, then obviously, the lens will not allow the reflex to be used to its greatest advantage. We know several workers who use short-focus wide-angle lenses on their reflex cameras, but they are obliged to mount the lens in a sunk lens panel and fit it after the mirror is raised and fixed, the focussing being effected by the back ground glass or by means of a marked scale on the side of the camera. As the lenses are used mainly for interiors for comparatively long exposures, it is not so important

Fibre needles must be used with these all these at the port the Customs official can check and sign your list. When you return to this country you need only to show the list, together with the apparatus concerned, in the Customs. In this way there is no need to show receipted bills, although there is no harm in taking them as well, in case the other list is mislaid.

Numbering Negatives.

Can you suggest a neat and permanent method of numbering negatives for indexing purposes?
A. J. (London.)



Use indian ink of the waterproof variety and a new, fine ball-headed pen and mark in the margin.

Press Agencies.

Will you kindly forward me a short list of photographic agencies who would handle amateurs' pictures? G. F. (Twickenham.)

We have frequently published lists of photographic Press agencies, but we repeat a few of them herewith: The Associated Press of Great Britain, Ltd., 2 and 3, Hind Court, Fleet Street, London, E.C.4; British International Photos, 176, Fleet Street; Central Press, Ltd., 119, Fleet Street; Keystone View Co., 12, Wine Office Court, E.C.4; Planet News, Johnson's Court, Fleet Street, E.C.4; Photopress, Ltd., 10, Johnson's Court, Fleet Street; Sport and General Press Agency, 2 and 3, Gough Square, Fleet Street, E.C.4; "Topical" Press Agency, 10 and 11, Red Lion Court, E.C.4; Wide World Photos, Salisbury Square House, Salisbury Square, E.C.4.

CAN YOU TURN YOUR PRESENT CAMERA INTO . . .

A ROLL-FILM CAMERA using the popular $3\frac{1}{4}\times2\frac{1}{4}$ film, and giving twelve $2\frac{1}{4}\times2\frac{1}{4}$ pictures costing only 1d. each ?

A PLATE CAMERA, for the many occasions when the subject requires immediate development. For specialist photography of machinery, scientific subjects, artificial light, etc., etc.?

A 35-mm. MINIATURE CAMERA, for occasions when one requires to carry large quantities of film material with as little weight as possible ?

A STEREO CAMERA, for stereoscopic pictures, which give the pictures a delightful plastic effect ?

If your camera does not do all these things

THEN CHANGE TO A

MINIATURE CAMERAS
A PART-EXCHANGE OFFER

At this time of the year—the peak of the photographic season—a tendency is noticeable for our stocks of second-hand apparatus to dwindle almost to vanishing point. In an endeavour to cope with this seasonal shortage, we have decided to make the following offer. To customers considering the purchase of new miniature cameras such as the Leica, Contaflex, Contax, Exakta, Super Ikonta, Rolleiflex, etc., we are prepared to quote really unprecedented part-exchange allowances on existing apparatus, whether miniature or otherwise. We are particularly anxious, of course, to obtain the miniature cameras in which we specialise, and for a short period our prices and allowances, either for cash or for part-exchange, will be higher than we have ever paid before.

When replying, customers are requested to describe their apparatus as fully as possible and to mark their envelopes "Part Exchange."

R. G. LEWIS

The Miniature Camera Specialist,

202, High Holborn, LONDON W.C.1.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS :

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue : 13 consecutive insertions, 5% ; 26 consecutive, 10% ; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry ; Guildhall Buildings, Navigation Street, Birmingham, 2 ; 260, Deansgate, Manchester, 3 ; 26B, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

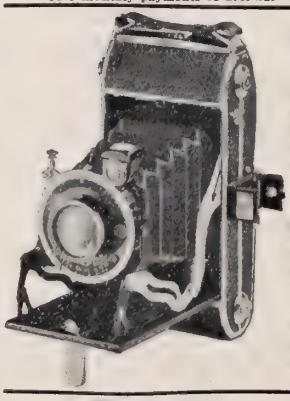
The ZERANAR lens fitted exclusively on the NORFOLK Camera is second to none

Read what this customer says:

"The Zeranar lens, even at f/2.9, covers well, and has excellent definition. I have already sold nearly forty photographs from negatives made with this camera, many of them were enlargements. . . . The 'Norfolk' is the seventh camera in my possession, and it has already become established as first favourite. During my thirty years' experience as an amateur photographer I have never handled a better instrument." Rev. W. T. R., Hobart, Tasmania.

NORFOLK—PLATE AND FILM PACK MODEL

3¼×2½ Plate and Film-pack Camera



(also adaptable for roll films), constructed of a light but strong alloy. Double extension, rising and cross front. Superior quality bellows, clear and direct-vision view-finders. Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer." The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged ; over £10 and under £50, 2/6 ; over £50 and under £75, 5/- ; over £75 and under £100, 7/6 ; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed **& Co.**

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

Simplex
AUTOMATIC DAYLIGHT-LOADING 'DEVELOPING' TANK

For roll films (2¼×3¼ inches)

Is the latest and definitely the simplest tank yet obtainable. There are absolutely no spare parts whatsoever. Convenient loading in broad daylight, thereafter developing, fixing, and washing are done without removing the film from the tank.

Entirely constructed of bakelite, therefore proof against acids and easy to clean. NO APRON.

Price, complete with wooden box for storage, **37/6**

SUPER-JUNOPLEX

Similar in principle and just as easy, but for V.P. roll films (1⅝×2½ inches).

Price complete..... **35/-**

USE A TRIPOD! AND GET BETTER PHOTOGRAPHS

THE 'ANGULAR' TRIPOD

The construction of this Tripod makes it stronger than any telescopic tripod made of round brass tubes, the sections being triangular. The ball-and-socket top can be instantly and securely clamped with the camera pointing in any direction.

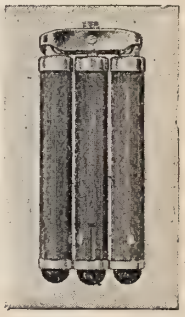
Price 12/6
Leather Case, 5s. 6d.

Without ball-and-socket top
Price 10/6
Leather Case, 4s. 6d.

THE 'TRI-SECTION' LIGHT-WEIGHT TRIPOD

A new light-weight Telescopic Tripod with outer sections covered in black ribbed celluloid. This Tripod is stronger and more rigid than the ordinary tubular tripod, the sections being triangular in shape. The height when extended is 47 in. Length when closed 10 in. Complete in leather case, with glove-button fastening and carrying handle.

Price, including case..... **22/6**



THE 'WALLET' POCKET TRIPOD

This new de luxe quality Pocket Tripod is made of light metal, the outer sections covered in black ribbed celluloid. The Tripod folds flat when not in use, and weighs only 15 oz., including the leather case. The length of the Tripod when closed is 8½ in., and the height when extended is 46 in. The leather case measures 9×2½×1 in., and has a glove-button fastening. It is fitted with a loop for attaching to the waist-belt or for carrying on the shoulder-strap of a camera case.

Price, including leather case..... **30/-**

THE 'MINIATURE' POCKET TRIPOD

This new de luxe quality Pocket Tripod is made of light metal, the outer sections covered in black ribbed celluloid. The height of the Tripod when fully extended is 44½ in. Length when closed 7 in. Fitted with non-slip rubber shoes. The weight, including the leather case, is 14 oz. only. The case has a glove-button fastening and is fitted with a loop for attaching to the waist-belt or for carrying on the shoulder-strap of a camera case. A perfect Tripod for use with a miniature camera. Price only, including leather pocket case..... **42/-**

BALL-AND-SOCKET TRIPOD TOPS "THE MIDGET"

Can be conveniently carried in a waistcoat pocket, and used on any metal tripod. The top revolves and can be instantly secured in any position.
Price, 2s. 6d. Postage 3d. extra.

Heavier pattern as supplied with "Angular" Tripod as above. 3s. 6d. Postage 3d. extra.

RUBBER TRIPOD SHOES

Will fit on the spikes of most metal tripods and prevent the tripod slipping on polished floors. Per set of three 9d. Postage 2d. extra.

FLIGHT & AIRCRAFT ENGINEER AND AIRSHIPS

The First Aero Weekly in the World

All the latest developments in connection with aviation are recorded in the pages of "Flight."

Illustrated descriptions of new aircraft, aero engines and equipment, British and Foreign, appear regularly, as well as practical articles giving the latest information for Club members and amateur pilots.

"Flight" is the leading authority on aviation. It contains Royal Air Force news, and deals with the work of R.A.F. Squadrons, with Private Flying, and with Commercial Aviation, Airlines, and Airports.

A special staff of highly competent aerial photographers ensures that "Flight" contains the finest photographs of aviation in all its aspects.

This Book will Help you to Pass the Driving Test!

MOTOR DRIVING MADE EASY

By
R. F. BROAD
and the TECHNICAL STAFF of "THE AUTOCAR"

Fifth Edition—Revised

All aspiring motorists who have to pass the driving test will find this handbook of great practical help.

It deals with the correct manipulation of controls of every kind, and explains the handling of cars with free-wheel transmission, synchromesh gears, pre-selection gears, and fluid flywheel transmission. Advice is given on what to do in emergencies and the motorist's legal responsibilities are set forth in simple language.

Size 7½ × 5 inches. 158 pages. Bound in paper boards with attractive coloured jacket

Turn Your Spare Apparatus into Cash

instead of letting it spoil on a shelf.

Advertise it in "The A.P."

Practically every photographer has apparatus of one kind or another of which use is not being made at present. In itself it may not be of great value, yet it may be just the thing another photographer is anxious to purchase.

At very little cost, by means of a small private advertisement in "The Amateur Photographer and Cinematographer," it is possible to get into direct touch with likely buyers of second-hand cameras, lenses, lanterns and enlargers, or any other kinds of apparatus.

All you have to do is to fill in the form below, enclose in envelope with the necessary amount in stamps or P.O. and stamps, and ADDRESS to : **PREPAID ADVT. DEPT., "THE AMATEUR PHOTOGRAPHER AND CINEMATOGRAPHER," DORSET HOUSE, STAMFORD ST., S.E.1**

£ | S. | d.

The Journal for Everybody with a Camera

Vol. LXXXII. Wednesday, July 8th, 1936. No. 2487.

A PRIZE Rolleicord PICTURE

This picture won a £100 prize for the photographer. This is what he says: *"With any hope of success in either child or animal studies one must have a camera that is able instantly to accept every opportunity that presents itself. When I took my prize-winning picture I immediately saw my chance, and in almost as many seconds I had taken three exposures—and then my opportunity was gone for good. The Rolleicord gives all the essentials for this class of work. The image is so clear on the screen that every change of expression can be noted, whilst it is next to impossible to focus incorrectly. With a Rolleicord the amateur stands to score every time over the professional studio photograph. For all classes of work, under all conditions, the Rolleicord is the ideal camera."*—H. D. H. VALLIS. Rolleicord Model II, with many new features and Zeiss Triotar f/4.5 lens, £14 10s., or Zeiss Triotar f/3.5, £16.

Ask your dealer to demonstrate Rolleicord Model II, or write for illustrated prospectus and name of nearest stockist to Sole Importers:

R. F. HUNTER LTD., "Celfix House," 51, Gray's Inn Road, London, W.C.1

Telephone: Holborn 7311/2.

There's no Question:

for your finest work you must use a panchromatic film . . .

Kodak "PANATOMIC" Film—the film of superfine grain—for all ordinary outdoor subjects—landscapes, portraits, etc. It's superb for enlarging.

Or

Kodak SUPER SENSITIVE PANCHROMATIC Film

—the film of lightning speed—for all quick-action shots where a high shutter speed is demanded—sports pictures, etc. This is also the film for all photography by artificial light.

Both these Kodak Panchromatic Films are made in Roll Films and Film Packs, and in 35mm. form for use in the "Retina," "Leica," "Contax" and other miniature cameras. From Kodak Dealers everywhere.

NEW WALLACE HEATON COMPETITION

For users of 35-mm. STILL CAMERAS

USERS OF LEICA, CONTAX, CONTAFLEX, RETINA, ROLLEIFLEX, and ROLLEICORD (if used with ciné film) can all compete.

Here is a new Competition, open only to users of cameras taking 35-mm. film as its negative medium.

The Competition is open from July 1st until September 30th. Your photographs can be of any subject—but they must be taken on 35-mm. film. Prints should not be smaller than 6×4 inches, nor larger than 12×10.

Any number of prints can be sent in in any one week, but each photograph must have the coupon attached. In addition to the big prize, a weekly prize of £1 1s. will be awarded for the best photograph submitted in that week.

Each photograph must have on the back a coupon as below, and the name and address of the sender, the make of camera and material used, exposure, etc.

ADDRESS YOUR ENTRY TO:

'COMPETITION'

for the best photograph submitted during the run of the competition

£25

will be awarded

COUPON which must be attached to your entry.
WALLACE HEATON
35-mm. Film Competition
July 8th, 1936.

ONE GUINEA WILL BE AWARDED FOR THE BEST PICTURE RECEIVED EACH WEEK. THERE'S NO ENTRANCE FEE.

For photographs which appeal to us, not necessarily prize-winners, we reserve the right to purchase the copyright by payment of £2 2s.; in the case of weekly prize-winners by the payment of an extra 21/-. The copyright of the £25 prize-winning print must be made over to us without further payment. *In addition we are offering a special prize of £1 1s. per month for the best photograph submitted depicting a person or persons using a camera purchased from Wallace Heaton Ltd. All prints will be judged at the end of the Competition for the final prize of £25 cash. Acceptance of these rules and conditions is a specific condition of entry.*

AGFA "SPEEDEX"

A first-class 3¼ × 2¼ roll-film camera. Get this handy little instrument in time for the holiday season. Fitted with f/4.5 lens and Compur shutter, direct-vision and reflecting view-finders.

£6 : 6 : 0

Nine monthly payments of 14/9.

"ROLLEIFLEX"

The easiest manipulated camera you could buy. Shows your picture full size and right way up on ground-glass screen. Fitted with Compur shutter, speeded to 1/500th sec., T. and B., and Zeiss Tessar f/3.5 lens.

£25 : 0 : 0

Nine monthly payments of 58/4.

FILMO "STRAIGHT 8"

Easy daylight loading. Takes 30-ft. reels, 4 speeds. Built-in exposure chart, f/2.5 lens. With case.

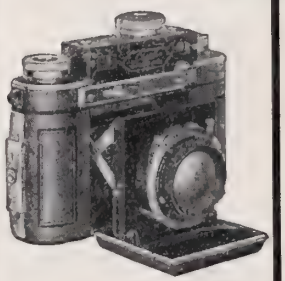
£20 : 10 : 0

Nine monthly payments of 47/10.

KODAK "REGENT"

The latest model, taking 8 or 16 pictures on 3¼ × 2¼ roll film. Has coupled range-finder, optical eye-level finder, Zeiss Tessar f/4.5 lens, Compur shutter, speeded to 1/400th sec., complete with leather case..... **£20:0:0**

Nine monthly payments of 46/8.



SUPER IKONTA

Takes 11 pictures on 3¼ × 2¼ 8-exposure roll film. Distance meter coupled with the focussing. Direct built-in view-finder, Compur **Rapid** shutter, speeded to 1/400th sec. With f/2.8 Zeiss Tessar lens.

£28 : 5 : 0

Nine monthly payments of 66/-.

"DOLLINA"

Takes 36 pictures at a loading on 35-mm. ciné film. Fitted with direct optical view-finder. Dimensions of the camera are only 5 × 3¼ × 1¼ in. over all projections. Rapid opening—easy to use. Has f/2 Xenon lens and Compur Rapid shutter, speeded to 1/500th sec.

£15 : 15 : 0

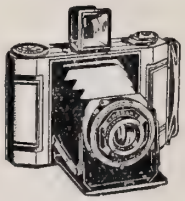
Nine monthly payments of 36/9.

THE "BESSA"

Takes 8 exposures on 3¼ × 2¼ roll film. Fitted with detachable mask, for taking 16 pictures when required. F/4.5 lens and Compur shutter.

£7 : 5 : 0

Nine monthly payments of 17/-.

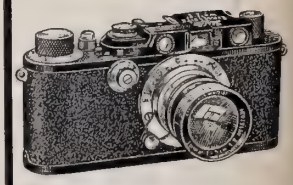


CINÉ - KODAK "8"

Halves running costs.—With fixed-focus f/3.5 lens, exposure guide, footage indicator and eye-level finders incorporated in the handle of the camera. Holds 25 ft. of special film, only half the width of which is exposed at a time.

£9 : 17 : 6

Nine monthly payments of 23/1.



KODAK "DUO"

16 pictures on 3¼ × 2¼ 8-exposure film. Lens shoots to position at touch of button. Focussing from 3½ ft. to infinity. Direct-vision view-finder.

With Pronto "S" shutter and Kodak f/4.5 anastigmat.

£6 : 0 : 0

Nine monthly payments of 14/-.

LEICA MODEL III

With f/2 Summar Lens.

Automatic focussing, 3 shots in 10 secs., anything up to 36 pictures one loading, double exposures impossible. For holidays, travel, or for photographs at night or in any weather, Leica is the ideal camera.

£39 : 10 : 0

Nine monthly payments of 92/2.

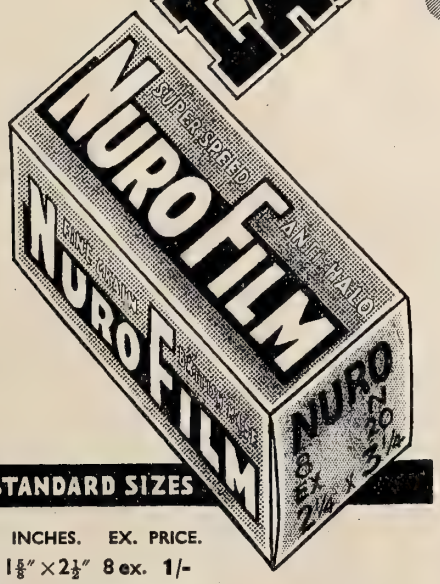
Granville PRODUCTS
PRODUCE BETTER PICTURES

Whether used by the novice, the advanced worker or the professional, GRANVILLE PRODUCTS ensure the maximum results with the minimum effort. Every day we receive testimonials from new customers who are surprised and delighted—surprised at the quality obtained at such a low price—delighted with the ease in which such perfect pictures are obtained. If you are just beginning, start right with "GRANVILLE"; if you have years of experience, change to "GRANVILLE." You will never change again!

"THE GRANVILLE GUIDE"

This new publication is a superb 16-page de luxe illustrated edition. Specially issued for users of Granville Photographic Products, it contains up-to-date working instructions, formulæ, and many useful articles specially written by our own experts. A complete list of all materials is also given, including many new lines. If you have never communicated with us before, **write to-day for your copy.** Applications should be addressed to: PUBLISHING DEPARTMENT, Granville Gulliman & Co., Ltd., P.O. Box 3, Leamington Spa.



If you have previously communicated with us, please do not apply, as a copy will be sent to you.

Only NURO, THE NEW ALL-BRITISH FILM HAS THIS NEW QUALITY

"Lastic Latitude" is an extra feature which, in addition to the outstanding quality of NURO Film, helps you to make better pictures. Scientifically correct density of every NURO negative is made very much more certain by "Lastic Latitude," which is the ability to absorb and automatically correct errors in exposure. Try a spool of NURO Film and test this remarkable new feature for yourself.

EXCITINGLY NEW!

THE Voigtländer RANGEFINDER BESSA

The Voigtlander Bessa is an established favourite—now comes a new model with features far in advance of its time. Like every Bessa, its trigger release, fitted under the baseboard, enables the camera to be held in both hands at eye-level. Like every Bessa it takes half-size or full-size pictures, but this new model has the added advantage of an optically perfect rangefinder which makes accurate focussing simple and certain. A particularly pleasant "streamlined" body makes this new "slip-in-the-pocket" Bessa decidedly handy. Study its features and prices listed below—and then ask to see it at your dealers. You'll say this new Rangefinder Bessa is the camera event of 1936.

FEATURES IN ADVANCE OF ITS TIME VALUE IN EXCESS OF ITS PRICE

- ★ Rangefinder coupled to lens standard, automatically sets lens to correct position at every distance.
- ★ Focussing, before or after opening, by large milled wheel with engraved distances and hyperfocal chart.
- ★ Optical view-finder with mask for half-size pictures.
- ★ Yellow hinged filter attached to lens mount.
- ★ Trigger release fitted so that finger falls readily on to it after focussing.
- ★ F/3.5 Voigtlander anastigmat lens and Compur Rapid delayed-action shutter.

With Helomar (3-element) f/3.5 lens,

£16 : 10 : 0

With Skopar (4-element) f/3.5 lens, **£18 15 0**, and Heliar (5-element) f/3.5 lens, **£21 0 0**. Compur Rapid delayed-action shutter (1 to 1/400th sec.), fitted as standard.

"... is a joy for ever"

THE

Rolleiflex

CAMERA, like some of its users, is "a thing of beauty," and it is certainly "a joy for ever." It is a miniature camera which is different—so simple to use—yet giving such exquisite results. The fact that the Rolleiflex has figured so largely amongst prize-winners of recent photographic competitions proves its established supremacy amongst roll-film reflexes. Every picture you take with a Rolleiflex can be "a thing of beauty," and, like the camera, bring you joy for ever.

Here are some of its features : 12 pictures on 3½ × 2½ roll film for 1/—enlargement expense eliminated. Simplest, most efficient focussing, with magnifier and ground-glass screen. Picture seen actual size, right way up, even during exposure. Instant readiness, with "stop," speed and focussing all in view. Zeiss Tessar f/3.5 lens. Compur shutter from 1 to 1/500th sec. and T. and B., D.V. finder for speed subjects. Option of plates or cine film. PRICE **£25**

58/4 DOWN AND 8 MORE MONTHLY PAYMENTS

Let us quote our allowance on your present camera against a new Rolleiflex.

THE *NEW* SIMPLICITY AND CERTAINTY

with which perfectly correct exposure is ascertained at the actual time of taking the photograph, has won a wealth of enthusiastic praise for the New "AVO" Exposure Meter. It is the simplest and most dependable meter ever made as well as the quickest to use. It is a boon to professional and amateur photographers alike, saving time, material and opportunities.

Mr. OLIVER G. PIKE, F.Z.S., F.R.P.S., M.B.O.U., writes:

"My film, 'Nursery Island' . . . owes the excellence of its exposures entirely to your 'AVO' Meter . . . . My 'AVO' told me the right stop every time, and I cannot speak too highly of it."

The New "AVO" EXPOSURE METER

FOR "STILL" OR CINE CAMERAS.

Prov. Patent

BRITISH MADE

- Unique method of exposure indication.
- Greater sensitivity. Gives exposures from 60 secs. down to 1/2 oooth of a sec.
- Exceedingly compact, for vest pocket. Size only $2\frac{1}{2} \times 2\frac{1}{8} \times 1$ in.
- Influenced solely by light received from normal picture angle.

And Panchromosa Special—extremely fine grain 21° Sch.

GEVAERT LTD., WALMER RD., LONDON, W.10

Of course, you know——

that the Camera shown here is a **LEICA—one of a wide range that you can see at any time at any of the FOUR WESTMINSTERS. Possibly you have thought that you would like to possess a LEICA—but price, and other considerations, may have caused you to hesitate. It is as well to know that you will find a Leica definitely easier to handle than the other cameras you have had—and it possesses helpful features all its own. You certainly needn't be *afraid* of a LEICA. For the rest, WESTMINSTER'S Liberal Exchanges and advantageous Out-of-Income arrangements are a sufficient answer to such other questions as may arise.**

This is the LEICA Model IIIa, having shutter speeds up to 1/1,000th of a second, f/2 Summar lens, and, of course, completely automatic focussing. It costs £43, or can be acquired by 9 monthly payments of £5 0 4. There are other models from £16.

MINIATURE CAMERAS
A PART-EXCHANGE OFFER

A response to our special offer published in the last two numbers of *The Amateur Photographer* has kept us at night working out quotations. **Up to date, 94 per cent of these have been accepted.**

In the past, memories of iodine lockets and slimming remedies have somewhat prejudiced us against testimonial publishing as a regular method of publicity. We cannot help, however, quoting from two letters received on the morning this advertisement goes to press.

". . . Your offer was more generous than that of any other firm to the extent of from 25 to 50 per cent."
(C. K. S., Edinburgh.)

". . . It is nice to know that one can change one's camera as easily and almost as cheaply as changing one's mind."
(C. W. S., Manchester.)

This week we repeat our offer of exceptional part-exchange allowances against miniature cameras; by taking advantage of which you will save several pounds. Customers are asked to describe their apparatus as fully as possible and to mark their envelopes "Part-Exchange." Any up-to-date apparatus not exceeding $3\frac{1}{2} \times 2\frac{1}{2}$ in size will be considered.

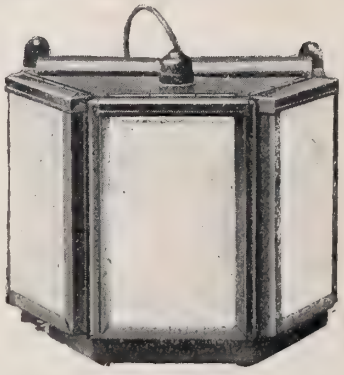
YOUR CAMERA'S CAPABILITIES

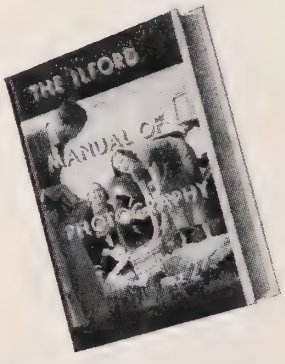
With these ILFORD *aids to Finer Photographs*

ILFORD PHOTO-ELECTRIC EXPOSURE METER



Absolutely accurate exposures improve the work of any camera. The Ilford Photo-Electric Meter shows instantly the correct exposure for any subject under all conditions. For Plates, Films, Cine Films and Dufaycolor materials. Price : **£3-3-0** in neat leather case.

ILFORD COLOUR FILTERS



There is a wide range of Ilford colour filters for landscape and general photography. Prices according to size. Full details of all Ilford Filters in leaflet "Ilford Colour Filters and Adjustable Holders."

ILFORD DARKROOM LAMPS & SAFELIGHTS

Safeguard good camera work with good darkroom lighting. Ilford darkroom lamps are made in many types, but have one characteristic in common—each ensures a high degree of illumination with perfect safety. Fully descriptive literature sent free on request.

THE ILFORD MANUAL

An enlarged and fully illustrated edition written by a staff of experts under the Editorship of Mr. George E. Brown, F.I.C., Hon. F.R.P.S., for 30 years Editor of *The British Journal of Photography* and the *B.J. Almanac.* In its 25 chapters, every branch of photographic work is covered and reliable formulæ given to help you add to your camera's capabilities. Price : **2/-** from all photographic dealers, or post free **2/6.**

ILFORD AMATEUR PHOTOGRAPHIC HANDBOOK

For beginner and experienced amateur alike, this book is a valuable guide to better results. Profusely illustrated and covering such subjects as the choice of a camera, the right film or plate to use, exposure, developing, printing, etc., it is of absorbing interest to every camera-owner. Price : **1/-** from photographic dealers, or post free **1/4.**

VOL. LXXXII. No. 2487.

TOPICS of the Week

ONCE a year our readers have the opportunity of seeing for themselves the original prints that are awarded prizes month by month in our competitions. The prize-winning pictures, and a selection from those awarded honourable mention, in "The A.P." Competitions for the past twelve months form the current house exhibition at the Royal Photographic Society, 35, Russell Square, W.C. As a great number of these photographs have been reproduced in our Art pages the visitor, who is also a regular reader, will be able to compare them with the reproductions, and, in view of the fact that in many cases the originals are "difficult" from the block-maker's standpoint, it will be admitted that our renderings generally do the originals justice. This exhibition of prize prints will demonstrate the high quality of the work submitted to "The A.P." and justify our frequently repeated comment that the entries are "well up to exhibition standard." The special award for the best print sent in during the past twelve months has been made to Mr. H. W. Lambert. The exhibition is open until the end of the month, and admission is free on signing the visitors' book.

Gnomes among Fairies.

Watching photographers at their work on various outdoor occasions these summer weeks, at village fêtes, sports, and so on, we have thought how useful it would be if someone could invest the photographer with a chameleon cloak so that he would merge into his surroundings. He would get better pictures and be less of an intrusion. He is tolerated because at all costs we must have it in the papers, or have a record of it somewhere; but we saw a pretty village festival the other day in which some daintily-dressed performers carried out elaborate dancing on the green which was a little spoiled because photographers, amateurs included, would get in among the performers to obtain a better view. Wells's invisible man would be highly successful as a photographer, though means would have to be taken to make his camera invisible also.

ON THE BROADS.

A typical snapshot taken in a favourite spot for holiday makers with the camera.

Standardisation in the Cinematograph Industry.

One of the great achievements in standardisation which was applauded at the annual meeting of the British Standards Institution the other day was the setting up of a national standard for educational sound films. Owing to the absence of any national standard for the 16-mm. sound films for educational, industrial, amateur and other purposes, their development in this country, it was stated, has been severely hampered. There have been two specifications available, one American and the other German. Those directly interested in the manufacture and marketing of the apparatus and the building up of film libraries were unanimously of the opinion that a single national standard was essential, and they approached the British Standards Institution on the matter. The proposal from a representative conference that decision should be secured by arbitration was agreed to, and Lord Riverdale acted as arbitrator and gave his award in favour of the standard prepared by the Society of Motion Picture Engineers of America. The British standard specification was shortly afterwards issued implementing the arbitrator's award. National

standardisation bodies throughout the Empire have been advised of the result of the arbitration, and it is confidently expected that they will all endorse the British standard specification. The South African Standards Institution has already taken this course. Recently at a conference of the cinematograph industry it was unanimously decided to request the British Standards Institution to set up a balanced and fully representative Industry Committee to be responsible for all industrial standards for the cinematograph and allied interests of this country.

The Age of Invention.

An international congress of chemical engineering was held in London a few days ago, and any one attending it who was not familiar with the ramifications of modern chemistry was in for surprises. At the end of the several days' sessions, after hearing a multitude of speeches in all sorts of languages, we were left with the idea that the chemist, after all, is the real Atlas who bears the world on his shoulders. The chairman of one of the sessions, an eminent Swedish chemist, remarked that twenty years ago he heard a debate among politicians and economists, who pessimistically declared that the age of invention was over, that it had its hey-day in the nineteenth century, and that with increasing populations it would become difficult to produce and distribute the necessary supplies. They had forgotten, said this Swede, the resources of the chemist. He believed that the future lay with chemical engineering, which would vastly augment the possibilities of civilisation and raise the standard of living.

Pictures on Loan.

It has come at last, what we have before now suggested in these columns as an idea worth pursuing, namely, a lending gallery of good works of art. The prospectus is before us, and it appears that by paying an insignificant percentage per month of the value of one of a big series of pictures by any one of a large number of modern artists one may borrow the work for that length of time, and also, by a series of instalments if desired, secure it altogether. But a month, after all, may be as long as one wants to have any modern work on one's walls. The idea that once a picture is hung in one's home it must be there for all time accounts for not a little of the lack of artistic appreciation in this country. There are very few pictures that one cares to make permanent inmates of one's home, but a vast number that would be welcome as guests for a short stay. If the idea catches hold it should be an important element in popular art education. For a relatively small sum, not beyond the means of most persons of taste and culture, it would be possible to have a dozen pictures in succession grace one's walls in the course of the year, and they would provide an ever-fresh stimulus to oneself and one's friends.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Potassium Bromide.

Sometimes in a formula I find so many grains of potassium bromide, and in another formula so many minims or drams of 10 per cent potassium bromide solution. Then I am told that sometimes negatives need bromide in the developer, and sometimes they don't. Am I supposed to make up two developers, with and without? Is there any possible way out of all this confusion? *D. C. (Clapham.)*

We think you can solve all these problems in a very simple manner by keeping at hand a stock solution of potassium bromide. Apart from any academic hair-splitting what we suggest is practically sound, and works quite satisfactorily.

Buy an ounce bottle of potassium bromide, and dissolve the contents in about 8 fluid ounces of water. Make up the solution to 9 oz. 1 dr. and put it in a bottle, where it will keep almost indefinitely. Write on the label "Pot. Brom. 1 gr. = 10 min." At any time you can measure out as many ten-minims of the solution as you require grains.

Suppose a formula prescribes 25 grs. of potassium bromide; you need not weigh out that quantity, but you measure out 250 minims of solution, this is 4 drs. 10 min. (The heavens will not fall if you make it just 4 drs.) But if the formula tells you to add a certain quantity of 10 per cent solution of potassium bromide, measure out that same quantity from your stock bottle, and neither you nor anyone else will be able to tell from the result that you have been using a solution which is not in a strictly scientific sense a 10 per cent solution.

As to your negative developer you can make it up without any bromide at all. If you think that negatives will be the better for bromide—as in the case of over-exposure, or perhaps stale material—you can add the appropriate amount. Suppose you are using 4 oz. of developer; see how much bromide would be right for 20 oz. and add one-fifth of that amount, securing the number of grains by measuring out that number of ten-minim doses.

Photographing Fonts.

In my wanderings I have photographed a few fonts—with varying success—but I now propose doing this sort of work more systematically. What do you consider the best camera for it? *R. R. B. (Malvern.)*

For some classes of work it is not possible to specify even a type of camera that is definitely better than several other types; but owing to the conditions and limitations of photographing fonts certain recommendations can be made.

We should be inclined to select a quarter-plate stand camera, with reasonably long extension, rising and falling front, and, of course, a focussing screen. For the lens we should prefer a good f/4.5 anastigmat of about 5-in. focus. Considerable stopping down is necessary, but the large aperture facilitates arranging and focussing the subject, especially as the lighting is often poor.

A shorter focus lens, say 3½ in., would be a useful addition, as space is sometimes restricted. Long camera extension is required when selected detail is to be photographed on a large scale.

A large focussing cloth, and a focussing magnifier are helpful, and the focussing screen should have one or more "clear spots."

The tripod should be adjustable for a low camera position, and the points should have rubber or cork caps to prevent slipping on smooth floors. Other methods can be used to prevent this trouble, such as standing the tripod on a mat.

As exposures are generally lengthy they can conveniently be given by means of a lens cap instead of a shutter, and there is no real necessity for more than medium speed in the sensitive material, especially if full exposures are given. These are nearly always necessary on account of the deep shadows, and sometimes strong contrasts of light and shade. In every way a very high standard of technique is demanded for such work.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Hot Weather Work

Even in England's hottest summer photography can scarcely be said to be conducted under tropical conditions. But there is no doubt that the rise in temperature which can usually be expected during the middle months of the year, necessitates alterations in the amateur photographer's methods of working, if certain photographic faults are to be avoided.

OUR bodies adapt themselves so readily to changes in the weather that we are often unaware of the ten degrees or so rise in temperature which results in over-developed and fogged negatives, stained and veiled prints of poor colour and contrast, frilled edges and blisters on the gelatine—and often frayed tempers.

The wise photographer uses a good thermometer and reads the makers' instructions before developing plates, films or papers, but when conditions are such that the most pessimistic manufacturer has overlooked them, special methods are necessary.

Effects of Temperature.

It is probably best to take conditions as they are found, and *not* to try to reduce the temperature to the figure thought desirable by adding ice or cold water. Water from the mains is generally several degrees colder than room temperature, and water intended for rinsing should be left in a jug in the dark-room for half an hour or so before use.

Freshly-made hypo will sometimes be near freezing point and is a frequent source of annoyance, while hypo solution left in dishes will often become so concentrated owing to the evaporation of water that crystals of hypo will appear.

The remedy is obvious in each case —test the temperature *and* wash the thermometer well, and keep an eye on the liquid level and some warm water handy to add when it drops. It is well worth while to use an acid hardening fixing bath in very hot weather to offset the softening effect of warm solutions on the gelatine.

Users of metol-hydroquinone developer should remember that the latter chemical's inert habits during the cold winter months are lost and replaced by an added energy, which too often is not allowed for, and results in badly over-developed negatives. The makers' developing tables allow for this and *must* be studied if good results are to be obtained. When in doubt curtail your time; a clogged negative is nearly hopeless, but there are several good papers available on which to print a soft, well-graded one.

Chemical fog is also a summer trouble, again avoidable by curtailed development, or if slightly false tonal values are not objected to it may be reduced by adding a little potassium bromide 10 per cent solution to the developer; the effect of two or three drops to the ounce should be tried first, as it slows up the action considerably.

A Hot-Weather Developer.

The softening effect of warm liquids on gelatine is aggravated by the carbonate of soda present in most developers. For this reason it is worth while trying amidol developer in hot weather. This is made up with sulphite of soda only, and gives fine clean negatives and prints, while variations in temperature have little effect upon its activity. Good formulæ for amidol developers have been given frequently in "The A.P."

Amidol has the additional summer merit of refusing to keep for long in solution. The word "merit" is used advisedly, for thousands of prints must be ruined annually by stale developer. A little is left ready for use for half an hour in a dish, or is taken from a bottle which has contained mostly air for a fortnight, and the hot weather demon shows his hand again, oxidation having made the solution practically useless. Made-up amidol developer will keep for perhaps a day if well corked, and though its short life raises one's wrath at times, it *does* make the would-be-lazy photographer use a fresh solution when he ought to.

Factorial Development.

The foregoing remarks apply equally well to negatives and prints, save perhaps that the use of too much bromide may result in a poor colour in bromide prints, but there is another method of overcoming increased developer activity which is best applied only to prints, that of factorial development. This process has often been described in these pages; it consists of developing for a total time which is a suitable multiple of the time of appearance of any image on the paper after immersion in the developer, and will give correctly developed prints over quite a large range of temperatures.

A very valuable addition to the dark-room chemicals in hot weather is some dilute hydrochloric acid. A drachm added to a pint of water makes a good "stop-bath" for rinsing prints after development and before fixation. The use of this will prevent stains, and if several prints are being developed together they may safely be transferred one after the other to the stop-bath and left there until all are ready to be fixed.

Formalin.

A ten per cent solution of formalin also proves invaluable in hot weather, being used to harden the soft gelatine after the prints and films have had the same adequate washing which they would be given in colder weather. Five minutes' immersion in the formalin will harden the gelatine on a plate to a point where it may be safely wiped with a viscose sponge or a piece of wet chamois leather to remove scum and surface moisture. This will hasten the drying, give a clean negative, protect the film from subsequent scratching when dry, and discourage the summer insects which often elect to picnic on the wet emulsion.

Ventilation.

Finally, some mention must be made of that most insidious enemy of good technical work, bad ventilation in the dark-room. This makes itself felt most in hot weather, when the desire for more cooling air is often conquered by anxiety to keep the room thoroughly dark at all costs.

Efficient light traps which enable plenty of air to pass them are easily made of three-ply wood or of cardboard, but if these seem too ambitious, try leaving all the natural ventilators, cracks under doors, etc., unblocked. Experience, aided by simple tests with scraps of bromide paper, will show if conditions are safe for printing, while a roll of dark material laid on the floor a couple of inches away from the door will effectively prevent the light, but not the air, from spreading.

The ideal arrangement, if it can be managed, is to have an air inlet at the floor level—say at the bottom of the door—and an electric fan to take the warm air out at the top, but properly light-trapped. Such an arrangement ought not to be beyond the range of the "handy-man," especially if the room is used regularly for photographic work.

M. L. H.

The Photography of Lightning

By EDGAR HONNOR.

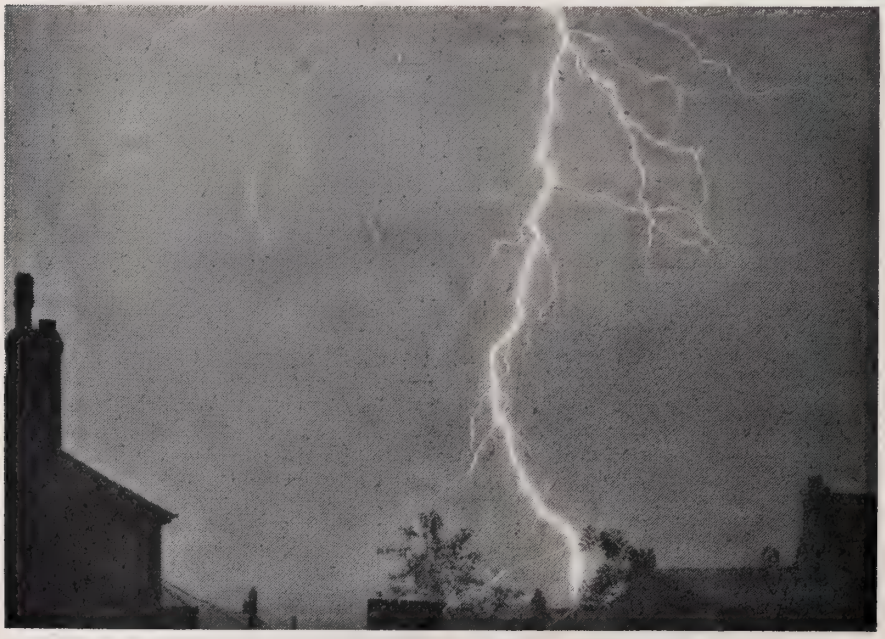
AN extremely fascinating branch of amateur photography, and one that is not so difficult as it would appear at first glance, is the photography of lightning at night. For this the best opportunities are likely to occur during the present time of year, when thunderstorms are frequently the finish of a sultry day.

A big advantage from the beginners' point of view is that the simplest apparatus is not only capable of giving good results, but is actually the best for the purpose. The only requirements are a lens aperture of f/8 or f/11 and a shutter capable of giving time exposures. Even a stand can be dispensed with. The accompanying illustrations are from a number taken with the camera held in the hand, and the largest aperture used was f/8. Equally good results are obtained with either " chrome " or ordinary film.

The method of procedure is as follows:—

The shutter is set at " time," the scale at infinity, and the aperture at f/8 or f/11. By studying the frequency and position of the first few flashes as the storm approaches, a good idea is obtained of when and where the next flash is due to take place. The camera is then placed to the eye (a direct-vision finder being the best type to use), and the shutter opened. Be careful to note that there are no street lamps, lighted windows, or other illuminations in the field of view, or these will be registered on the film as mysterious streaks.

A wait of a minute or more may be necessary before the flash occurs, but this will not matter if the night is dark, as until the discharge there is nothing to register. When the flash does occur it will " take itself."



F/8. Verichrome Film.

If the operator's judgment has been correct he will see the flash through the finder, and have the thrill of knowing that he has made a successful " catch." The shutter is then closed, and the film wound on for the next " shot."

If a particularly spectacular (but untrue) picture of lightning is wanted, two or more flashes can be registered on the same film. In this case it will be well to have the camera fixed on a tripod, or the foreground objects will have double or treble outlines, and give the game away.

With regard to processing, the only rule to be observed is to give full development, as the result is in the nature of a silhouette. It may also be necessary to use a bromide or gaslight paper of " vigorous " grade to give contrast.

Both the photographs reproduced above were taken as described in this article.

The Perfect Combination

- **AUTOMATIC FOCUSSING by Quick-Action Lever coupled to Range-Finder.**
- **F/4.5 ENSAR ANASTIGMAT or other lenses to choice.**
- **MULCHRO, PRONTOR or COMPUR SHUTTERS.**
- **RISING & CROSS FRONT MOVEMENTS.**
- **DIRECT OPTICAL VIEW-FINDER built into range-finder casing.**
- **FILM REGISTERING DEVICE ensures absolute flatness of the film.**

ENSIGN AUTO--RANGE

FOR PICTURES $2\frac{1}{4}'' \times 3\frac{1}{4}''$

The camera which incorporates all the worth-while refinements at a moderate price.

With the coupled range-finder you save all the worry of focussing and are able to concentrate on composition and exposure. The quick-action lever is adjusted until the two images in the range-finder coincide. The lens is then automatically in exact focus.

PRICES :

With Ensar Anastigmat f/4.5, Mulchro Shutter ..	**£7: 10: 0**
With Ensar Anastigmat f/4.5, Compur Shutter ..	**£9: 15: 0**
With Ross Xpres Anastigmat f/4.5, Compur Rapid	**£14: 15: 0**
With Zeiss Tessar Anastigmat f/4.5, Compur Rapid	**£13: 17: 6**

ENSIGN, Limited, HIGH HOLBORN, LONDON, W.C.1

Those delightful holiday memories need recording with a good Camera

Every keen amateur photographer likes to possess a really rapid anastigmat. The ideal anastigmat for work all the year round, summer and winter, bright or dull days, indoors or outdoors, is one possessing an aperture of f/3.5. "Ah!" we hear someone say, "But what about the expense?" The expense is probably much less than many imagine. For example, the Nettar, a high-class 100 per cent self-opening camera carrying the Zeiss Ikon trade mark and guarantee is now supplied equipped with the Zeiss Ikon Nettar anastigmat f/3.5 and Rapid Compur shutter (1/400th sec.)—rapid, because a fast lens must have a fast shutter speed—for the extremely moderate price of £9 10s.

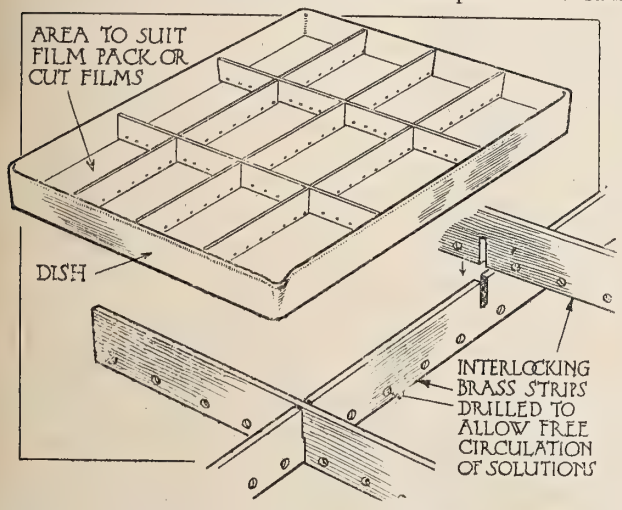
NETTAR

Of course other equipments are available fitted with f/6.3 and f/4.5 lenses. These are listed under, but use the f/3.5 Nettar for preference.

With Nettar f/3.5, Compur Rapid shutter	£9 10 0
With Nettar f/6.3, Derval shutter	£3 15 0
With Nettar f/4.5, Telma shutter	£5 10 0
With Nettar f/4.5 and Compur normal shutter	£7 5 0
With Zeiss Tessar f/4.5 and Compur normal shutter	£9 17 6

The Nettar takes any make of roll film, but preference should be given to Zeiss Ikon film, on account of its extreme rapidity and its fineness of grain, its ability to render colour correctly in monochrome, and the latitude permitted in exposure and development.

Zeiss Ikon products are obtainable from most high-class dealers. Name of nearest stockist, together with 24-page photogravure booklet, post free on request.



ZEISS IKON

ZEISS IKON LTD., 11, Mortimer House, Mortimer Street, W.1

Readers' Hints, Tips and Gadgets

DISH DEVELOPMENT OF CUT FILMS AND FILM PACKS.

THE development of a single cut film or a film from a film pack is quite satisfactory by the dish method, but when more than one film is developed in the same dish there is a general tendency for the films to get into a bunch when the dish is rocked, and this often causes uneven development and scratches.

The simply constructed device illustrated is suitable for the development of twelve $3\frac{1}{4} \times 2\frac{1}{4}$ cut films or the contents of a complete film-pack, and entirely obviates this difficulty.

It consists of five strips of thin brass, three of which are 12-in. long (i.e., the length of the dish) and the other two 10 in. (the width of the dish).

It is necessary to interlock each strip and in order to do this cuts are made halfway through the width of each strip as illustrated. Holes must also be made in the strips, preferably near the bottom. This is to allow the free circulation of the developer.

By placing the strips so that each cut coincides, a framework is made. This is then placed in the dish and a film put into each compartment.

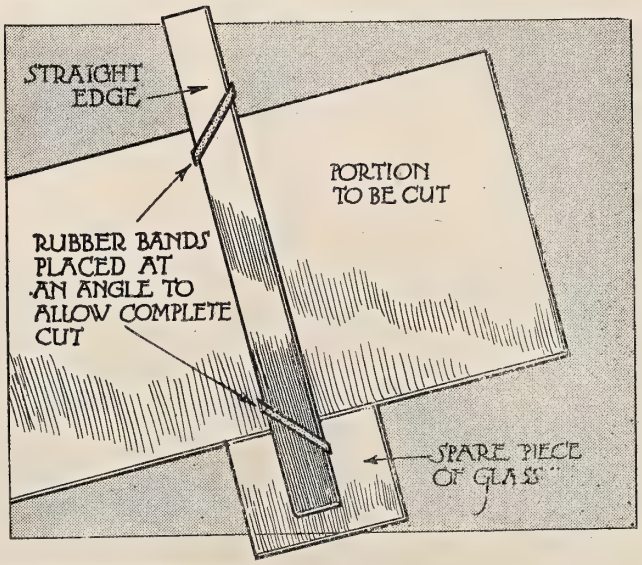
When the developer is poured in the dish it will run freely into each partition and the dish can be rocked gently without the negatives slipping.

A cover, such as a piece of card or three-ply, placed over the dish will then save it from stray light, and it can be safely left.

The size of the dish, etc., need not, of course, be adhered to, as it depends largely on the size and the quantity of films to be developed, and the various sizes given can be adjusted to suit individual requirements.

L. G. HONE.

SOME HINTS ON GLASS-CUTTING.

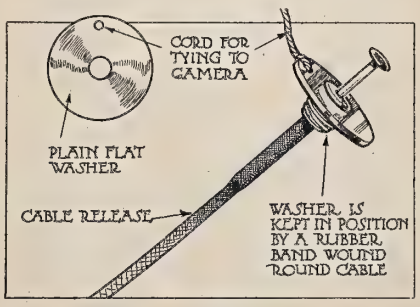


ONE of the uncertainties about glass-cutting is the tendency of the straight-edge to slip on the polished surface of the glass while the cut is being made with the glass-cutter, which may be either a wheel or diamond.

Unless two hands are on the straight-edge, one each end, it is almost bound to slip, particularly if a long cut is being made. Two flat rubber bands slipped over the straight-edge will solve the problem, and if they are each placed at an angle, as shown in the sketch, there is sufficient rubber to grip the glass, and yet sufficient clearance is given to clear the stroke of the glass-cutter both at the beginning and the end.

A good hint on cutting glass to a certain size is to mark or trim a piece of white paper to the size required. Place this under the glass and simply use it as a guide for the cutter. This ensures accuracy and squareness.

It often happens that the finish of the stroke under pressure fractures the glass at the edge. To avoid this, place another piece of glass against it opposite the cutting line as shown in the lower part of the sketch. The cut can then be taken right through the main glass without the cutter dropping at the edge and possibly splintering the glass. Always clean the glass before cutting, as a trace of grease causes the cutter to lose its cut and a second try on the same line is troublesome.



A. BRIDGE.

IMPROVING CABLE RELEASES.

THERE is no doubt that the wire or cable release is excellent for releasing the shutter without jarring the camera, but the push-button end to the release is not as comfortable as it might be.

The device shown here improves the wire release and can be fitted in a second by any one. It also has the advantage of providing a means of securing the cable to the camera or case to prevent it being mislaid. First obtain a flat, circular washer (the one illustrated was obtained from a radio shop), and see that the centre hole is just large enough to slide over the shank of the stationary collar, but not too big that it will pass right over the end of the collar. A 3/16ths-in. diameter hole is usually about the right size. If it is desired to attach the cable release to the camera, drill another small hole near the edge to take a cord. The washer is then placed on the collar as shown, and all that is necessary to secure it in position is a rubber band wound round the cable shank many times. Apart from being more comfortable to use, this device offers a greater certainty about the moment of release, as it seems to make the thumb push more sensitive.

If the diameter of the washer is too large to permit it being packed with the camera, a small piece can be cut from the left and right of the washer.

C. B. ANGUS.

PAGE

By RONALD GOODEARL.

King Henry VIII at Pageant of England, Langley Park, Slough. 1/100th sec., f/4.5, pan. film.

THE season for pageants has again started, and they are being organised for a variety of purposes in all parts of the country. Most of them will be held out of doors in suitable landscape surroundings, and the camera enthusiast should try and secure as many pictures as possible, whenever the opportunity offers.

The subject is a very attractive one, and good pictures are obtainable with the simplest apparatus, while with a little care photographs of exhibition standard may be secured. The illustrations to this article are incidents from pageants that are over, but will give the reader a good idea of what to aim at.

To obtain the best results it is advisable to obtain permission from the organisers of the pageant to move about at the sides or in front of the seating accommodation, thus avoiding the disadvantages of working from a fixed position. As a rule, provided the photographer does not make a nuisance of himself, good photographs of the performance will be welcomed by the organisers, if they are produced in ample time for reproduction.

A frolic at Samuel Pepys'. The Penn Pageant at Jordans. 1/50th sec., f/8.

Queen Elizabeth with her Court, Langley Park. Taken from roof of grandstand. 1/50th sec., f/4.5, 1500 H. & D. Press plate. Dull day and raining.

If the secretary or pageant master is approached some time before the date of production he or she will probably allow photographs to be taken at the dress rehearsal. This will much simplify matters, for there will then be no risk of obstructing the view of other people.

The programme should be carefully studied and any parts of the action, or tableaux, which appear likely to provide striking pictures marked beforehand. Then, while these scenes are in progress the

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

ANTRY

An attractive outdoor topical subject for the amateur photographer.

Betrothal of Lady Blanche Plantagenet. A scene at the Kempsford Pageant, Gloucester. 1/100th sec. f/6, S.S. pan.

camera can be kept ready for immediate use.

As the players move about it will be noticed that at times they are grouped very attractively, and the exposures should only be made at these moments if really "live" pictures are required.

Of course, the usual precautions should be taken with regard to the direction of the light, and

Farewell to the "Welcome." Penn Pageant at Jordans.

backgrounds need careful watching or trees or unwanted figures in the distance may mar the pictures.

Panchromatic material is the best for this subject as a large number of the costumes are almost sure to be red, though a fairly good rendering can also be obtained on a plate of the self-screen type or a fast ortho film such as Selochrome or Verichrome.

A lens of moderate speed will be found suitable as, the pageants being held in summer, the light will be good even if the weather is cloudy. High shutter speeds are seldom wanted, as the action is generally slow and deliberate.

In the event of it being necessary to work from a seat, a place should be booked either in the front row or next to an aisle which will enable photographs to be taken without obstructing the view of others. A telephoto lens will sometimes be found a great help, as otherwise, if the seats are a fair distance away, it will be necessary to resort to considerable enlarging to obtain a print of any size.

Of course, much can be done by posing the performers before or after the pageant, but great care is necessary if the results are to appear natural. Some fine costume figure studies can be obtained in this manner, and heads on a large scale should also be attempted.

Parade of the Pageant makers. 1/50th sec., f/8, pan. film.

Rural Pillow-Lace makers. At a Girl Guides' Pageant.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS

Readers who have been considering joining "The A.P." Continental Photographic Motor Rally should make their decision without delay, as the time is approaching when the list must be closed. Particulars of the itinerary and details of the cost, etc., have already been published in these pages during the past few weeks. They will be supplied on application to the Editor of "The A.P.," or to Autocheques, Ltd., Piccadilly House, 33, Regent Street, S.W.1.

A reader (R. F. B.) who is anxious to join the party makes the following proposition: He is experienced in Continental driving, knows the roads in the proposed itinerary, and is a keen photographer and speaks French. He will either (1) provide a car (10 h.p. Ford Saloon, with accommodation for two passengers and luggage in comfort) in return for passengers sharing his expenses, or (2) offers services as driver to any one wanting a relief, etc., in return for expenses or major proportion of them. Any reader interested will please address R. F. B., c/o Editor, "A.P.," and mark letter "Motor Rally."

Ensign, Ltd., are adopting a striking method of advertising Ensign films during July and August. Special aircraft will visit the entire coast of England and Wales during the holiday season, and the inhabitants and visitors at the seaside towns will see, written in the sky, the message "For Better Snaps use Ensign Films." This will be in the form of an enormous streamer that will be easily readable. Messrs. Ensign are to be congratulated on their enterprise.

An attractive catalogue of the "Balda" cameras has just been issued by The Norse Trading Co., Ltd., 37, Rathbone Street, W.1. This range of cameras include the well-known "Baldina," the "Baldax," the "Baldi," the "Baldaxette," the "Venus Wafer" plate camera, and a new twin-lens reflex—the "Reflecta." These are all fully illustrated and described, and particulars are also given of the "Perplex," "Superplex," "Perkino," and "Superkino," "Junoplex" and "Simplex" developing tanks. A copy of the list will be sent free on application to the above address.

A new camera club has been formed under the auspices of the Edinburgh Y.M.C.A., at South St. Andrew's Street. All the usual facilities will be provided, and any amateur photographers in Edinburgh who are interested should apply for full particulars from the Secretary, J. D. Jack, Edinburgh Y.M.C.A. Camera Club, 51, Roseburn Terrace, Edinburgh.

A novel weekly competition is announced by Wallace Heaton, Ltd., for readers of "The A.P." This is open only to users of cameras taking 35-mm. film, such as Leica, Contax, Contaflex, Retina, Rolleiflex and Rolleicord (if used with ciné film). £1 1s. will be awarded every week until September 30th for the best print sent in, when a prize of £25 will be given for the best print sent in during the three months. Further particulars and coupon will be found in Wallace Heaton's advertisement on another page in this issue.

The Camera Company, of Vauxhall Bridge Road, S.W.1, advise us that in their advertisement of the "Avo" meter in last week's "A.P.," an illustration of the original model was used in error instead of one showing the new model to which the advertisement referred.

The Coronet Camera Co., of 310, Summer Lane, Birmingham, 19, have issued a well-illustrated leaflet folder containing particulars of the full range of Coronet cameras. A copy will be sent free on application, also an illustrated booklet dealing with the Perutz film.

A change of Secretary is announced by the Walkden and District Photographic Society. All communications should now be addressed to Mr. W. E. Partington, 474, Manchester Road E., Little Hulton, Nr. Bolton, Lancs.

The well-known range of Bessa cameras made by the firm of Voigtlander has been added to by a new model, the "Rangefinder Bessa." This, as its name indicates, has a range-finder as an integral part of the instrument and works in conjunction with the focussing adjustment, which moves the complete lens. An optical view-finder is also fitted and the operation of focussing is controlled by a large milled wheel conveniently placed. The entire movement is simple and efficient, and correct focus is arrived at in a minimum of time. The shutter is the Compur delayed action, with speeds from 1 to 1/400th sec., and T. and B., and is actuated by a trigger release protruding through the baseboard. The convenience of this will be appreciated by every practical worker who tries it.

A Voigtlander yellow filter is hinged to the shutter front and can be placed in position instantly when required. The camera can be closed with the focussing setting in any position, or the focus can be set with the camera shut. Provision is made for sixteen half-size or eight full-size $3\frac{1}{4} \times 2\frac{1}{4}$ exposures, and the finder opening is adjustable for either size. The camera is strongly made and beautifully finished, with leather-covered stream-lined body, and well up to the high standard set by this firm. The prices range from £16 10s. with Helomar f/3.5 lens, to £21 with Heliar f/3.5. The sole British Agents are Schering, Ltd., 188–192, High Holborn, W.C.1, who will supply further particulars of the Bessa cameras and the complete Voigtlander catalogue free on application.

A new catalogue containing particulars, illustrations and prices of the full range of cameras and accessories supplied by R. F. Hunter Ltd., "Celfix House," 51, Gray's Inn Road, London, W.C.1, has just been issued. It is an excellent and informative booklet that our readers should hasten to secure for themselves. A copy will be sent post free on application to the above address.

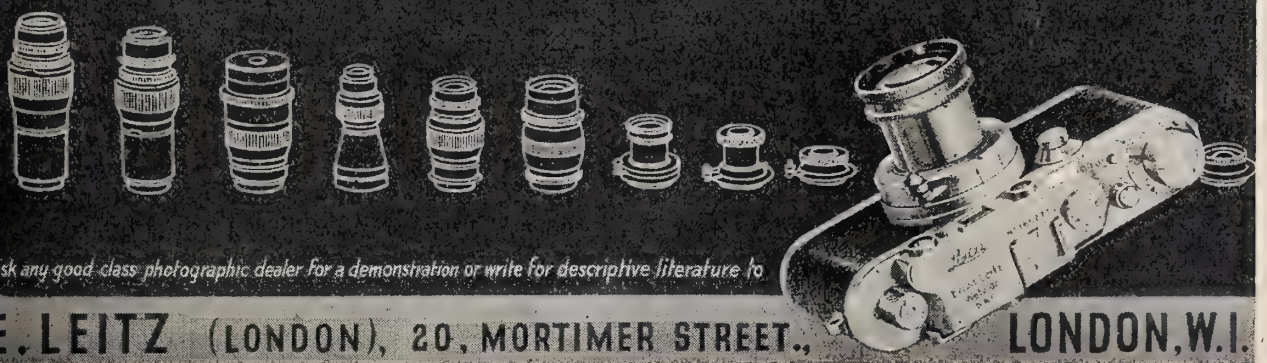
Ilford Ltd., in conjunction with Mr. Stewart Bale, have arranged an exhibition of photographs of R.M.S. *Queen Mary* in the Hall Annexe, India Buildings, Liverpool. About 150 pictures will be on view, including those recently shown at the Ilford Gallery, High Holborn. The exhibition will be opened by the Lord Mayor of Liverpool, on Monday, July 13th.

The winner of last week's Wallace Heaton Competition is Mr. R. Moore, 13, Georgeville Gardens, Barkingside, Essex. Particulars of the latest competition for "A.P." readers will be found in Wallace Heaton's advertisement in this issue.

An exhibition of photographs of life, scenery and industries of New South Wales, presented by "Sun Newspapers," of Australia, will be opened in the Australian Court Exhibition Galleries, Imperial Institute, South Kensington, to-morrow afternoon (July 9th), by The Hon. B. S. B. Stevens, Premier of New South Wales.

Addresses wanted.—Mr. A. Wemyss, of Newcastle-on-Tyne, and Mr. A. R. MacKinnon, of Edinburgh, have written to the Service Company of 289, High Holborn and the Westminster Photographic Exchange of 81, Strand, W.C.2, respectively, both in regard to apparatus, but have forgotten to send their full addresses. If they are readers of "The A.P." will they kindly oblige.

The Hon. Secretary of the Lincoln Camera Club, Mr. R. David Harris, advises us that his address in future will be Haydnholme, Sudbrooke, Lincoln.



Leica

THE UNIVERSAL CAMERA FOR ALL TIMES AND ALL OCCASIONS

12 RAPIDLY INTERCHANGEABLE LEITZ LENSES OF VARYING FOCAL LENGTHS AND APERTURES WILL SOLVE ANY PROBLEM. SNAPSHOTS AT HOME BY ORDINARY LIGHTING; TELEPHOTOGRAPHS OF WILD ANIMALS IN NATURAL SURROUNDINGS; CLINICAL PHOTOGRAPHY. NO TASK IS TOO BIG FOR THE LEICA.

Largest and most varied Stocks; the most Generous EXCHANGES; Best EXTENDED PAYMENT Plan

(Always Earliest with the Latest)

The Amazing WESTEX Roll-Film Cameras . . .

8 or 16 on normal 3¼×2¼ film.

Superb f/4.5 anastigmat in focussing mount, delayed-action Prontor II shutter, 1 to 1/150th sec., T. and B. Sturdy all-metal body, best leather covering and bellows. Self-erecting front, optical direct-vision and brilliant finders. Hinged easy-loading back, panchromatic safety covers ..... **£4 : 8 : 9**

Nine monthly payments of 10/5.

Velvet-lined Leather Case, 6/9 extra.

"WESTEX FOUR-FIVE"

Here are some "WESTEX" Advantages :

1. Highest class design and finish throughout.
2. Finest hard leather covering, nickel-plated edges.
3. F/4.5 anastigmat lens of exceptional quality, giving splendid results.
4. Most modern type focussing adjustment.
5. Shutter has 8 speeds, 1 to 1/150th sec., delayed-action device.
6. Both finders have masks for alternative picture sizes.
7. Quick, high-precision movements.
8. Latest type high-efficiency film transport.
9. Simple enough for novices, yet fully adequate for the most exacting expert.
10. Best value obtainable, sold with the full **Westminster** guarantee.

"WESTEX JUNIOR"

Takes 8 pictures 3¼×2¼ on standard film. Fine f/6.3 anastigmat in focussing mount. Self-erecting front, ready at a touch, direct-vision and brilliant finders. Quite unparalleled at its price..... **42/6**

Nine monthly payments of 5/3.

● Ask for WESTEX Roll Film Camera List. Full of Information and Bargains ●

THE "WESTEX MINIATURE"

A most efficient high-precision camera at a marvellously low price. 16 pictures 4×3 cm. on standard V.P. spool. Splendid results, easy manipulation. Quick, self-erecting front, f/4.5 Vidanar anastigmat lens, focussing down to 3 ft., Vario shutter, 1/25th, 1/50th, 1/100th sec., T. and B. Direct-vision optical finder. Beautifully made, very compact, slips easily into your pocket. Price (as above) **£3:12:6**

Nine monthly payments of 8/7.

With Radionar f/2.9 anastigmat and Prontor shutter, 1 to 1/175th sec., T. and B. **£5:12:6**

Nine monthly payments of 13/2.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXLI.

Mr. FRANK MACEY.

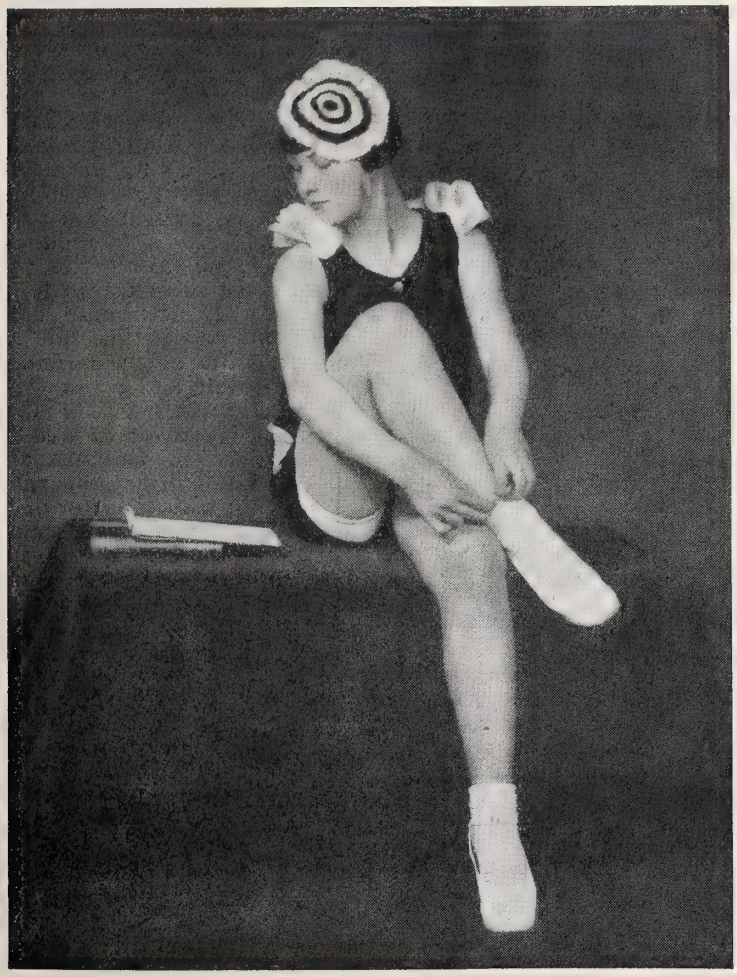
From information communicated to our Special Representative.

"PHOTOGRAPHY holds its greatest appeal to me when childhood is the theme; and I have spent many happy hours with suitable kiddies as my stars. Unfortunately a Peter Pan has so far eluded me; they will persist in growing up just when we have become accustomed to each other's funny ways.

"Being a sun-worshipper I will photograph anything if his genial rays are showing the subject at its best; and I always ask myself this question before making an exposure, 'Will this beat the other fellows in open competition?'

"The cameras I use are a quarter-plate Sanderson, very old but very good, and a $3\frac{1}{4} \times 2\frac{1}{4}$ Graflex, with a $5\frac{1}{2}$-in. lens and a $12\frac{1}{2}$-in. Telephoto—an ideal combination for child portraiture. This Graflex is an old comrade, and as we have both been knocked about a bit we have a perfect understanding, and I would not exchange him for the finest modern reflex.

"Panchromatic roll and cut films have now displaced orthochromatic varieties in my esteem, and I also use Ilford S.G. plates, desensitised in pinacryptol green, and developed with Rytol by inspection.



"Enlargements $4\frac{1}{4} \times 3\frac{1}{4}$ are made from all negatives, whether they look promising or not, and are pasted in albums. If on inspection I find a print which I consider good enough to raise a hair on an eyebrow of a jaded photographic judge, then I make a 10×8 Kodak Royal enlargement, carefully spot it, and steam it at the mouth of a kettle. As my beard grows longer my sense of humour grows stronger, and my spirit of tolerance ever more pronounced; so that faked prints do not arouse in me a single spark of anger. But I do try to keep my pens, brushes and paints for my Whatman paper and Bristol boards.

"Whenever possible I use a tripod when making an exposure, and if there is any novice reading this who knows less than I do, my advice to him is to go and do likewise. Probably that seed will fall on stony ground, but it has been fully tested. Another good friend of mine is the Burroughs Wellcome Diary and exposure calculator, and immediately after making an exposure full details of light, time, etc., are entered in it. If necessary, the circumstances under which an exposure was made at any time during the last five years can be found.

"All my negatives are stored in numbered albums and envelopes, and a book containing the titles and numbers of my negatives and albums enables me to obtain any particular one without handling the others.

"In conclusion I should like to render unto Cæsar the things that are Cæsar's, for whatever photographic knowledge I possess is due to the diligent study of *The Amateur Photographer*. Constantly striving to improve my work, faulty negatives and prints are laid as stepping-stones to better photography, for I hold an inquest on every one."

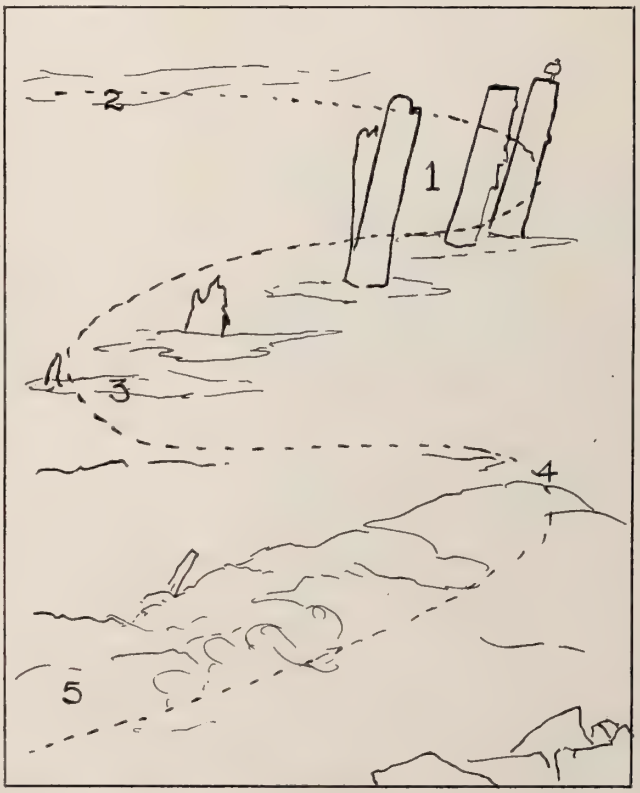
(*A further example of Mr. Macey's work is reproduced on one of the centre Art pages.*)

A NEW PART. *Frank Macey.*

Pictorial Analysis

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"SUMMER MORNING," *by W. Ecclestone.*



DESPITE the severity with which the subject material has here been restricted, the picture, as a whole, attains a high measure of success, and there is no suggestion either of meagreness or the lack of interest that arises from insufficient material. Nor is there any sensation of emptiness that might have happened were the space inadequately filled.

On the contrary, it seems remarkably complete and finished. The material, too, is of a somewhat unusual character, for most people would not think of trying to make a picture with a set of old piles for the centre of interest, and yet it is these, in conjunction with the sense of brilliance imparted by the sparkling reflections of the sunlight, that give the subject its attraction. The unusual character of the subject matter does, in fact, enhance that attraction by the addition of a suggestion of novelty, and this is stressed by the choice of a downward looking viewpoint.

The group of piles at (1), with their forceful darks, dominate the picture. Not only have they a strength of tone which is self-evident, but they have strength of position, and the emphasis they derive from the placing of certain of the most brilliant lights in their vicinity.

The depth of tone, in a scheme that consists almost entirely of lightish half-tone, immediately attracts the attention. The lights, by force of contrast, seem to intensify the strength of those darks and confer an additional power, while the position of this group—occurring at one of the points of intersection formed by divisions of thirds vertically and horizontally—is full of force and imparts yet a further measure of attraction.

With the main attraction so strongly concentrated in the vicinity, the impression of unity is well sustained, and the remaining elements fall naturally into place. The dots of light in the upper portion at (2), for instance, seem to occur in just the right place, for the horizontal line in which they lie counters the upward thrust of the line suggested by the direction assumed by the splashes of lighter tone lower down at (3) to (1). Below this line, is another stretching from (3) towards (4), also indicated by touches of brilliant tone, and this, again, is opposed by a further line formed by the foam of the breaking wave which runs down to the bottom corner at (5).

This arrangement of line imparts a feeling of a zigzag formation that immensely adds to the impression of unity by the connection it establishes throughout the picture. It is akin to the well-known " S " curve or line of beauty, and, except for the fact that it has an additional curving return tagged on at the top, might be taken as an example of that formation. The effect is much about the same, at all events, and it does add a certain grace to the composition that could scarcely be achieved by other means.

Nevertheless, it is highly improbable that any of these details of arrangement were thought out and consciously adopted at the time of exposure. It might be that the position of the piles was determined after considering them in relation to the rest of the subject content, and a certain judgment exercised in the selection of such a moment for making the exposure when the splashes of light seemed satisfactorily disposed; but, there being no time for anything else, what choice there was must have been purely instinctive, and the actual inclusion of the " S " formation would be wholly fortuitous. There is a further probability, too, that a great deal more than appears in the print was included in the negative, and that the present boundaries were only determined after careful thought as to the portion to be included and what could be left out.

During that stage of after-treatment, it might well be that the zigzag formation was observed and the print trimmed to make the most of it, but composition at the time of making the exposure is rarely a practical proposition, and, as here, it is generally a case of a vague instinctive selection with a large margin for contingencies.

At any rate, most exhibition pictures by our most prominent workers seem to be built up on lines such as these, and, as far as a long experience of work in the field discloses, it is a sound and fruitful method, for not only does it enable full advantage to be taken of a momentary inspiration, but it also provides ample opportunity for developing it afterwards and displaying it to the best possible advantage.

"MENTOR."

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

THE first and last of the prints reproduced on the opposite page—"The Reaper" (1), by V. L. Breeze, and "Harvest" (6), by John Poppleton—have points of similarity, for they are both farming subjects and both contain groups of horses and men.

Distinctions and Differences.

"The Reaper," perhaps, has a certain advantage in that the scale of the group, owing to the well-judged viewing distance, is just about right, whereas, in No. 6, there is rather more than a suspicion of restriction owing to the greater relative size of the cart and figures, and the consequent diminution of the proportion allowed for the setting.

Both show good sky renderings, and, technically, there is not much between them. No. 1 shows its group at a better angle than the other, for it discloses a three-quarter view as compared with the almost broadside-on presentment of the latter. On this account its form is more graceful, and it has another advantage inasmuch as the figure seems to "come" better against the sky, and the foreground and distance do show an indication of opposition of line.

On the other hand, the flails of the reaper strike a rather "liney" note, and, if they are not very insistent, they do not show so attractive a shape as the load of the cart in the other.

No. 6, too, conveys a better feeling of action, but suffers, to some extent, from having two figures, of equal prominence, in different parts of the picture. This causes a division of interest that is only too obvious, and it is a pity, also, that the one on the right betrays his knowledge of the presence of the camera.

Figures as Features.

Camera-consciousness of this kind should always be guarded against, for, while it is recognised that it is not easy to prevent, it introduces a suggestion of an outside influence that minimises the effect of whatever action the figure is shown as being engaged in.

How to avoid it is always a problem, but keeping the camera concealed until the last possible moment is often an aid, and, on other occasions, it has been found that open display of it and the making of dummy exposures so familiarises the subject with it that they lose their interest and take no notice of it at all.

However—camera-consciousness or none—both examples, with their figures, show up well in comparison with No. 4, "Morning Sunlight," by S. P. Parr, where their lack, in view of the emptiness of that stretch of foreground, is severely felt.

If the effect of morning sunshine were really and truly suggested, their absence, perhaps, would pass unnoticed. But there is not enough shadow to make the sunlight evident, nor, in such circumstances, can it take rank as an effect. A long stretch of shadow tone in the immediate foreground might make a considerable difference, but nothing of the sort exists, and, of course, it cannot be manufactured.

Landscapes and Skies.

The sky, with its well-shaped cloud, is a very good feature, nevertheless, but it is scarcely enough to sustain a pictorial interest in itself.

In this respect it displays an advantage over No. 2, "Tenby," by John Hothersall, Jun., where the lack of sky tone is most regrettable. There is, too, a similar insufficiency of tone in the water as well, and, while a softer grade of printing paper might be expected to offer some improvement, it would not be so effective as if a light filter had been employed in the first instance.

This is an extremely useful expedient, particularly when employed in conjunction with fully colour sensitive plates or film. Even with the "Iso" or "Ortho" variety, it usually enables skies and clouds to be more truly rendered; but, of course, it also involves a considerable increase in the exposure time.

With more tone in sea and sky, together with a bit of sunshine, "Tenby" could be made into quite an attractive thing, for it does disclose a good idea of arrangement and is not without grace of form. In a somewhat similar way, the idea and arrangement of No. 3, "Pride and Envy," by J. C. Fitzgerald, are quite sound; but, in a subject like this, where all the interest lies in the foreground, it would have been wiser to have arranged for the entire exclusion of the sky.

Stance and Viewpoint.

A considerably higher viewpoint, and one that is directed at a more downward looking angle, seems to be needed. Such a stance would, besides avoiding the inclusion of that annoying piece of sky, also have the advantage of bringing the faces of the figures against a darker portion of the setting.

It might also, if the existing relationship were retained, have the disadvantage of showing them either in too much of a line or in such a way that one obscures the other. However, this is a contingency that could be avoided by the choice of a moment when they were more favourably disposed.

When changing the viewpoint, it would also be found desirable to view the subject from a little farther off. The setting seems very much curtailed, and both the boat and the figures are shown on a scale that is too great for it. At the same time, it would be as well to endeavour to avoid the inclusion, also, of that out-of-focus line in the bottom right-hand corner. It appears to arise from a portion of the rigging of a boat very close to the camera, and intrusions such as these can very easily spoil the best of work.

The Central Position.

"Sty Head Tarn" (5), by A. E. Wood, appears to have been taken when conditions—judging from the presence of such a quantity of snow—were somewhat arduous and far from encouraging.

Under such conditions it is far from easy to give the question of arrangement the consideration it needs; but, in landscape especially, it is very important that a figure should not be placed so precisely in the centre. The forms of nature, almost without exception, are the reverse of formal, and very seldom indeed even approach symmetricality. Placing the figure centrally involves a formal suggestion, which is therefore incongruous, but a trim of half an inch from the left removes the disability. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

A BIT OF FAKING.

I DO not propose to enter into a discussion of the pros and cons of what is comprehensively known as "faking" in photography. There will never be general agreement as to where to draw the line between the legitimate and the reprehensible. Many disputants take the extraordinary line that you may do anything you like, or can, with a negative, but that the print from it must be absolutely "straight." Others claim that it does not matter in the least how the final picture is produced so long as the result desired is secured.

There is no doubt that many of those who so loudly and virtuously condemn faking, do so not because they think it is "wrong," but because they cannot do it themselves. They are "purists" from necessity, not from honest choice.

Here is an example of the sort of case that arises when faking is discussed. A negative is too weak for its purpose; it would be better if it were strengthened by intensification. Very good; we pour over a solution which will do the trick, or we bleach the image and redevelop it. It is chemical action, and the strictest of purists approve.

But suppose that only certain parts of the negative need strengthening. One man may protect the already strong parts by painting them over with rubber solution, before applying his intensifier; another may paint on the bleacher with a brush only where it is wanted. The purists are horrified; for although precisely the same chemical actions are involved, a brush has been used, and with considerable skill and judgment. This is an artist's job, and therefore a photographic crime.

Crime or no crime, I am going to describe a useful bit of brush faking. I am a hardened criminal myself, and stick

Fig. 1.

Fig. 2.

at nothing if there is a decent chance of not being found out.

With all our skill and care it is a common thing to get negatives that are too thin and clear in parts. These parts come out darker than we want them in the print, and they are of such a nature that we cannot put things right by local shading.

In the days of glass negatives of reasonable size, from quarter-plate upwards (not downwards), two methods of "dodging" were in common use. The first was to flow matt varnish over the glass side (and up the sleeves), and when it was set to scrape it away with a knife where it was not wanted. The retarding action was increased by using red or yellow varnish, or by working on the varnish with pencil, stump, or pigment.

The second was to take a sheet of translucent paper, as free from grain as possible, attach it by its edges to the glass side, and work on that with blacklead, etc., as in the case of matt varnish. A good draughtsman could work wonders in this way, sometimes too wonderful to be true. There were many other dodges as well, which I will not reveal now, but you can take it from me that the reputation of the "old masters" was not based on a purely photographic foundation.

A rather later dodge was to paint over the thin parts of a negative on one or both sides, the depth and colour of the wash retarding the printing more or less as required. The red dye, coccin, was generally used, or sometimes red ink as a substitute.

The obvious difficulty is to judge the printing effect of a red tone compared with the grey tones of the negative, and the effect would be much greater with enlarging on bromide paper than with printing by daylight. For this and other reasons I welcome the introduction of Johnson's Retouching Dye, which was recently briefly reviewed in this paper. It is about the same colour as Payne's Grey, and goes well with the tones of a "clean" negative. I also found it easy to apply.

My first test was on the negative from which the illustrations are made. Both negative and subject were poor, so that there was no risk in experimenting, but I now have no hesitation in treating similarly any negative that requires it.

The negative is soaked for a time, and the surface moisture removed with chamois leather or Agfa sponge. A film negative is laid on a piece of glass for treatment, and this or a glass negative can be supported in a retouching desk if one is available. Anyhow, light must be reflected through the negative.

A drop of the dye is put on a palette or saucer, and diluted with water to the tone required—generally a very pale one. This tint is applied to the film, in a thin even wash, with a sable brush. The wet gelatine helps to even the wash, and several pale washes can be applied at intervals.

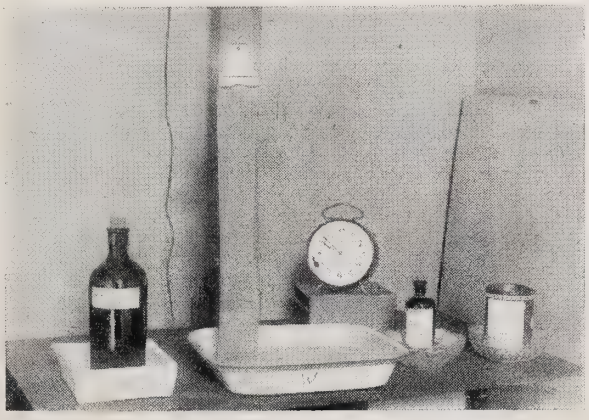
The differences between Figs. 1 and 2 are partly due to the use of slightly different papers, but far more to the application of the dye. Some of the modifications are lost in reproduction.

It is clear, however, that the dark building at the back has been lightened, so that the woman's shawl stands out better against it. A wash was taken over her apron, and over the shadows of the man's face and so on. The only way to learn how much can be done by this method is to try it. With a small brush and light touches even a miniature negative can be thus "faked." But experiment first on wasters; you will soon be anxious to try others.

W. L. F. W.

DARK-ROOM ECONOMY

By H. WHATES.



ONE must have proper photographic dishes for most purposes, but they can be usefully supplemented by cheaper articles to be had for a few pence from the domestic bazaar.

Enamel pie-dishes costing sixpence each make deep whole-plate size containers for water, hypo and other solutions used in fair quantity. Not having had photographic uses in mind, the makers finish these dishes with rounded corners that just prevent a whole-plate print from lying flat on the bottom, but half-filled with solution they will hold a number of such prints with plenty of room for movement.

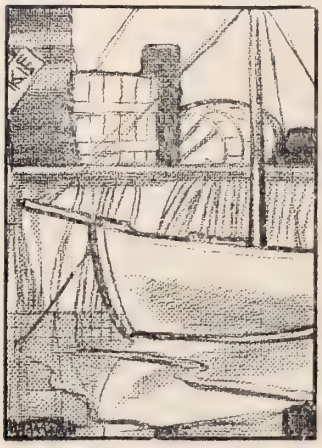
Another handy article is a shallow glass bowl, about 4 in. diameter at the rim, intended for sugar and sweetmeats. This is just the thing for developing roll film by the dipping method recently described in "The A.P." After soaking, the film is held by a clip at one end and raised and lowered into the developer, rolling and unrolling in the process.

After trying several patterns of tank and methods of dish development, I have standardised a system that yields clean, undamaged negatives evenly developed, and free from fog. For what it is worth, this is the arrangement, as used to develop films of the sixteen-on-$3\frac{1}{4} \times 2\frac{1}{4}$ variety.

On the bench from left to right are: (1) A deep $\frac{1}{4}$-plate dish nearly full of pinacryptol-green desensitiser; (2) a whole-plate pie-dish of water; (3) a glass bowl, as mentioned, with three ounces of double-strength Azol (40 minims to the ounce), and (4) a similar bowl with 5 ounces of acid fixing solution.

Work-bench arranged for roll-film development.

In total darkness, detach film from backing-paper, unroll it into the water, attach clip at end, and raise and lower in water until it hangs limp full length. Immerse in desensitising bath by the same method for three minutes, counting the "ticks" of a cheap alarm clock, which most considerately registers precisely a hundred ticks to a minute. Switch on safelight. I always use a yellow bromide screen, equally suitable for desensitised pan. or fast ortho film.



In this bright light it is easy to process the film in small quantities of developer and hypo. But before transferring to the developer the film should be rinsed, and again, between developer and hypo.

An objection sometimes raised to hand development of roll film is the occurrence of "aerial fog." My impression is that this mysterious disease is simply old-fashioned light fog showing itself on fast emulsions. By using stronger solutions for half the normal time chances of fog are minimised.

One word of warning. When buying cheap enamel and glassware, run a finger-tip round the inside and choose specimens free from rough spots.

Picture Points

No. 7 (New Series) *by RICARDO*

The Case for Reflections

IN last week's series of "Picture Points" we discussed the disadvantages of photographing reflections in still water purely for their novelty in duplicating the original subject. But because reflections can be too much like a mirror, it does not follow that they should be avoided altogether. Here we have a case in point. The top sketch shows a boat at anchor in harbour, a favourite subject with many. If we were to photograph it as such, with the miscellaneous irritating packing cases included, it would be far from pleasing. Let us take a lower viewpoint and see if, by cutting out the top half, we can obtain a more interesting arrangement. Unless there are more boats in the foreground it is possible that we should get something like that in the lower sketch. The whole *motif* is changed—it is now mainly reflections and the surface of the water is the deciding factor of the nature of these reflections.

It must be remembered that at least a portion of the original subject should always be included to provide the key-note.

Don't cut off the "Feet"

WE are so used to seeing every living or animate object provided with an adequate means of support, that as soon as they are deprived of it, or they appear to be falling over, we are quick to sense it. If the suggestion is made photographically it becomes disturbing and likely to affect what other good points the print may possess. In actual life, as soon as an object loses its support it topples over until it finds another form of support, but capture it with a camera about to fall over, and reproduce it on paper, we are, literally speaking, waiting for the crash, and this is uppermost in our mind all the time we are looking at the print.

This question of basic support is really the fundamental of balance, a highly important item in pictorial composition, and it is only by studying its various forms can we develop a sense of good balance.

In the top sketch both the figure and the tree are shown unsupported at the base and, although they are both in natural positions, as can be seen in the lower sketch, we are conscious that the "feet" are missing, and so we judge the picture to be weak. Compare it now with the lower sketch and feel the satisfaction of seeing them both on a firm support.

There is now no tendency in this second sketch to follow the figure and the tree out of the bottom of the picture, and the base also links the two together and gives added unity to the general arrangement.

On Leading the Eye out of the Picture

ALL good pictures should attract the eye to some point inside their four edges, where the main point of interest should be, approximately. If any line or mass tends to lead the attention away from this point then the print loses interest because of the mental effort required to disregard this counter-attraction. Immediately there is any conflict aroused in the mind's eye between the various items that go to make up a picture, it loses its appeal.

There are various devices that can be employed to coax the eye into the picture, the most simple of these being a line, and the straighter it is and the quicker it can be followed. When, however, we have two straight lines converging at a point to form a wedge shape, it is almost impossible to disregard them. So that whenever we find in our prints any such wedge shapes, we must either see that they lead to the main point of interest or else weaken them in some way or other by breaking them here and there, or by varying the neighbouring tones with the same intention.

The left-hand sketch illustrates the pulling power of wedge shapes, and it is immaterial whether they contain dark or light tones. The point of each wedge is marked with a cross. The attention is consequently reciprocating between both sides of the print and there is no one resting point.

The right-hand sketch shows the faults remedied. A figure is placed near the point and the other point is brought nearer the centre by lowering the viewpoint of the camera. Notice that the figure is looking into the picture space.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

ON using a RED FILTER

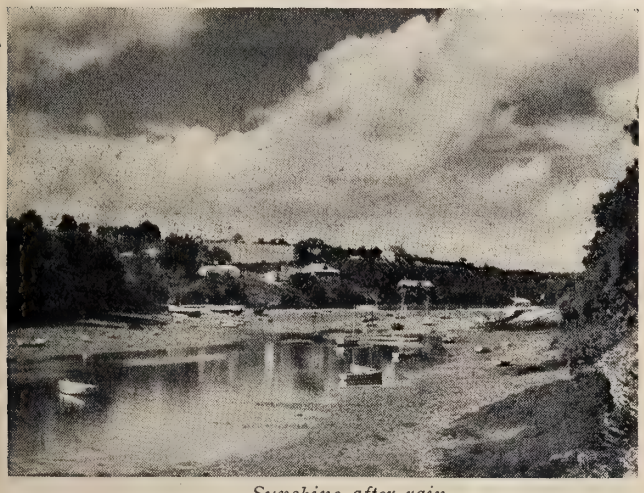
By KEN. G. BILBE.

MOST amateurs turn their attention at one time or another to landscape and seascape photography, and those who do their own printing are nearly always anxious to bring out cloud effects.

Very few fully exposed and developed unscreened negatives will produce clouds unless masked or otherwise controlled in printing, and even when this is done it is generally the reproductions of monochrome effects only, such as storm clouds, that are recorded.

All emulsions, even those that are non-ortho, are capable of recording such cloud forms, and the use of filters with any type of emulsion would not materially alter them, although with pan. films or plates there would be a general improvement of tone values throughout the negative.

However, when there is colour in the sky, a yellow or pale green filter can work wonders with almost any modern film. The 'chrome type films respond considerably to a pale yellow or even a green filter, but to photograph through a red one a panchromatic film is needed.



To get the most striking effects for this special variety of over-correction, the sky should be a definite blue. If a piece of red glass is held to the eyes when looking at white clouds in a blue sky, the increased colour-contrast caused by the blue parts being darkened will be very marked. The film or plate is affected in practically the same way.

Cumulus and wind.

Fine weather clouds and sunshine.

Sunshine after rain.

An Ilford Micro 5 filter is as good as any for this purpose, but the exposure must be multiplied about four times when it is in use. A certain haze-cutting effect is another advantage of such a filter, and also, in landscape work, it will be noticed that certain greens are lightened while others seem to be darkened. A panorama of field patchwork is greatly enhanced in this way, because of the greater contrast between hedges, trees and grass and earth.

One very good point about the red filter may be seen when a photograph has been taken of an expanse of water on a bright day. The blue of the water is darkened in the same way as the sky, and the sparkle and reflections are brought into prominence.

In general work, a red filter is useful for lightening any objects of reddish-brown colour, or if one has to photograph something or somebody against a blue sky. In this case it will darken the sky background so that it emphasises the high-lights of the subject to advantage.

But it is with cloud effects that the red filter will prove most attractive to the amateur. All landscape workers realise the value of cloud formations in landscape compositions, and also in imparting certain atmospheres such as wind, rain, storm or sunshine. Yet only by getting them all on the same negative, without having recourse to printing-in, can these features be faithfully rendered.

Those who have not yet tried a red filter with pan. plates or films should certainly do so. They will be delighted with the results, and even if they may be over-corrected the dramatic effects will be definitely pictorial. It must not be supposed, however, that a red filter, or one of any other colour, can be used for all subjects. Their effects must be studied, and they must be used with discretion.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

A CONDENSER SUBSTITUTE.

SIR,—Having read in "The A.P." so often of difficulties with condensers may I give the following hint? Having bought an old half-plate camera I made an enlarger. All went well except the light. I did not intend to go to the expense of a condenser, so I made a square frame and glued a sheet of ordinary greaseproof paper to it as an experiment. I can assure you it was wonderfully successful. I have done enlargements up to 12×14 and from Midget negatives. If any reader wishes to try it they will never want to worry about condensers again. The paper is about 6 in. in front of the lamp, 100-watt pearl, and 3 in. behind the negative.—Yours, etc., H. BILLINGS.

THE QUARTER-PLATE CAMERA.

SIR,—The fact that two photographers writing in your issue of June 10th both favour a quarter-plate Press-type camera with coupled range-finder is, I feel, much more than a coincidence.

Only last week I came to the conclusion myself that just such a camera would be ideal. Most serious photographers prefer the quarter-plate camera, the only disadvantage of which is the focussing, the slowness of which frequently results in the loss of a picture, or alternatively an unpleasant "fuzziness" through incorrect focus.

Is it too much to hope that a British firm will take this matter up seriously and produce such a type? Its sale is assured amongst amateurs and Pressmen alike.—Yours, etc., DEREK SURTEES.

JUDGING EXPOSURES.

SIR,—Granted that the use of an exposure meter is always to be strongly advised, there *are* times when it is impracticable to use one. There may not be time, or it may even have been left at home. Those who, like myself, began by trying to get the best possible results from a Box Brownie, may find the following tip useful.

Kodak's informed me that the approximate exposure and aperture of a Box Brownie is 1/25th at f/13.3. To simplify matters let us say f/11. Now a fair amount of experience with a Box Brownie enables one to estimate if there is too much or too little light for a snap. Thus, using a more expensive type of camera, if one imagines a Brownie in hand, and mentally calculates from 1/25th at f/11, I venture to suggest that the result will not be far wrong.

Personally, I have obtained some good results by guessing along these lines, even with indoor exposures. It really depends on how much experience one has had with a Box Brownie.—Yours, etc., ERIC W. PAGE.

MY IDEAL CAMERA.

SIR,—There have been several letters with this or similar titles, and I do not propose to add to them so far as to describe my ideal—if I have one—but there are one or two points in previous letters which are of interest, and to which I should like to refer in detail.

First is the suggestion that film manufacturers should make 3¼×2¼ films with a second set of numbers dividing the film into twelve parts. This seems an admirable suggestion which may well be commended to the manufacturers. Such a film would then do for the 3¼×2¼, the 2¼ square and the 16-on-3¼×2¼ cameras. A beginning might be made on those films most useful to the small camera, i.e., fine-grain panchromatics.

Secondly, a correspondent wants—quite rightly—a rising front of three-quarters of an inch, and also an f/2.9 lens; his lens will need to have a covering power of 3 inches square. In addition to this, in order to enlarge adequately he will want a first quality lens, and I think he will find that that, with a Compur shutter, will leave him a very small margin for the rest of his camera; at least such is the impression I gather from looking through the catalogues of first-class lens makers.

Thirdly, the idea of a telephoto lens being formed in front of the back component of the normal lens is interesting; at present with a roll-film camera and between-lens shutter there is no way of changing lenses, except to a slight extent by supplementary lenses. It may interest the correspondent who suggested this to know the result of one or two tests which I have made. A 3-in. lens was first focussed on the ground glass and the camera fixed in this position. The front lens being removed I put on an Adon variable telephoto, and adjusted this till I obtained a good image of reasonable magnification; I then measured the effective focus of the Adon as so adjusted and also that of the resulting compound lens, and found as follows, the figures for convenience being merely approximate: Back combination 6 in., telephoto 20 in., result 10 in. Tests with another lens gave back combination 13 in., telephoto 30 in., result 20 in. That is, a 3-in. lens can be transformed into 10 in. and a 6½-in. to a 20-in. Of course either the combined telephoto would have to be used at a fixed focus, or another scale would have to be provided. I should have said that the definition was quite good, so far as a visual examination showed; as good as the original lens. Of course, too, in practice a very simple form of telephoto would be required, nothing either so heavy or so complicated as the Adon.

Finally, if the camera is to be really ideal, a wide-angle lens, or a supplementary lens, with power to rack back sufficiently, is needed, again with either fixed focus or a third scale.

But when the amateur gets all this he will find himself far on towards the cost of some of the already-established models.—Yours, etc., C. E. FALKNER.

CAMERA SUGGESTIONS.

SIR,—I heartily endorse Mr. Robins' letter, and it may interest him to know that a number of my serious photographer friends have been discussing this matter.

In spite of the magnificent results obtainable with miniature cameras, they are pre-eminently suitable for close-up work, but do not give the quality obtainable with larger instruments when photographing landscapes.

The camera I would suggest should be 3¼×3¼ for roll film, made of light metal to reduce weight when carrying. The extreme robustness of some makes seems quite unnecessary, as a serious photographer does not play football with his camera.

A single-lens type is preferable, with a choice of lenses to suit the pocket of the purchaser. Focal length about 5 inches, with suitable supplementary distance lenses.

The shutter should be of the 1 to 1/100th sec. type, everset, like the Ensign Mulchro. High speeds and delayed action are seldom needed, and the added expense is not justified.

A 3¼×3¼ print makes an admirable picture for album use when it is not desired to enlarge.

Will any British manufacturer come forward with a simple instrument on these lines, and would one of them give some idea of what it would cost?—Yours, etc., C. G. M. H.

A KODACHROME HINT.

SIR,—May I pass on, through the medium of your excellent magazine, a good dodge I have devised with regard to economising on Kodachrome film? Due to the peculiar effect of colour upon constant vision, it is possible to project colour film at a slower rate than is the case with monochrome. If this is done, the speed will have to be balanced up, and so the Kodachrome may be exposed at a speed of twelve frames per second, *unless*, and this is very important, there is an excess of white in the scene, in which case this rule may not be applied.

This is in effect equivalent to increasing the aperture by about one stop, which is in itself a great asset whilst filming when the light is none too good, or by the bane of every Kodachrome user's life—artificial light.

Another point not to be despised is the saving effected by using Kodachrome at twelve frames per second. In fact, on being worked out, it is found that Kodachrome may be more cheaply used than super pan. monochrome at normal speed.—Yours, etc., J. BOULTBEE.

Would you believe it!

Black and White or Natural Colour Movies in your pocket with the

ENSIGN SIMPLEX

16 mm. Cine Camera

You simply cannot make *worth-while* home movies with anything other than first-class apparatus. The ENSIGN-SIMPLEX POCKETTE is the only amateur movie camera combining :—

IT'S TRUE!

A MINIATURE SPEED CAMERA WITH A FOCAL PLANE SHUTTER for 35/-

EVER-READY CASE 10/-

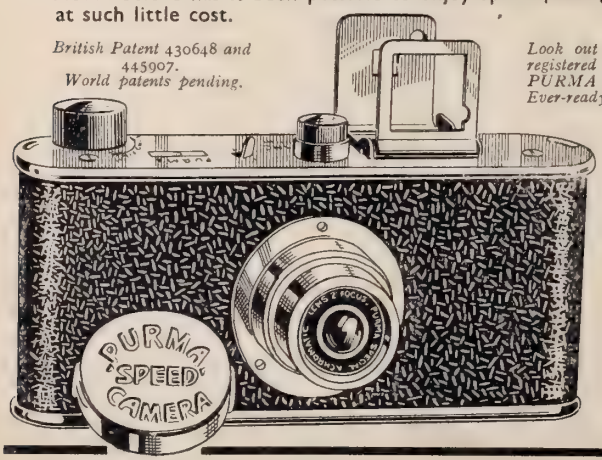

Illustration shows the Purma Speed Camera with Ever-ready case, in action.

No longer need you envy the man with an expensive camera, able to take any and every kind of "speed" subject. Here is a camera at every man's price, equipped with the type of speed shutter which the Press photographer insists upon.
Get a Purma Speed Camera to-day and take action pictures of diving, racing, birds in flight, children at play, and the numerous other subjects which you have often attempted with an ordinary camera and failed. Six instantaneous speeds 1/25th to 1/200th sec., 16 pictures on 1/- vest-pocket roll film. No focussing necessary—everything from 6 ft. to infinity is sharply defined. Never before has it been possible to enjoy speed photography at such little cost.

British Patent 430648 and 445907. World patents pending.

Look out for the registered name PURMA on the Ever-ready case.

THE AMATEUR PHOTOGRAPHER & CINEMATOGRAPHER

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

The Complete Holiday Film

By S.E.L.M.

JUDGING from the many amateur reels which are projected at open meetings, there is little doubt that the holiday film is far and away the most popular of any. Nor should this occasion any surprise, since at one and the same time the enthusiast has ample leisure, interesting material and (for the main part) extraordinarily good weather, all entirely at his disposal.

Some of the films, however, leave a great deal to be desired. Many of them are far too short. Others fire one with an instant longing to take them away and do the cutting all over again. There is a feeling, too, that insufficient care has been taken to select only the most appropriate viewpoints.

But the greatest and most obvious failing is undoubtedly a general lack of completeness.

Preparation.

Now, it is almost impossible to obtain this quality in a film without a certain amount of careful preparation beforehand. Indeed, any reel that will have to endure a great deal of subsequent showing and criticism must essentially enjoy as much preparation as the holiday itself.

The first step should consist of the drawing-up of a written "plan." This should then be developed by the sectional method—in which separate attention is devoted to every phase or section of the holiday. The usual and familiar phases are (1) Getting Ready, (2) The Journey, (3) Arrival, (4 to, say, 7) Holiday Activities, (8) *Au 'revoir!* and (9) Home Again!

Touring and other holidays which do not conform to such sequences can nevertheless be treated in strict accordance with the original suggestion.

Sequences.

The first sequence, in which both the planning of the holiday and actual departure scenes are shown, can be filmed without undue haste or flurry. It is best to start at the very beginning—showing, if possible, the main reason leading to the selection of the particular resort which will feature in the later sequences.

The opening of the film itself should be deliberately and strongly carried out, two of the principal objects here being to strike a high quality of production and to establish as many characters as possible, prior to the departure proper.

Packing and departure scenes should be painstakingly rehearsed before the shots are made, such rehearsal not only making for an economy of action, but also accustoming "raw" characters to the presence of the camera. The rehearsal method cannot, of course, be applied to the filming of departure scenes at a railway station or boat jetty—though all but the close-up shots can be secretly taken provided suitable "cover" for the camera-man be available.

The journey and arrival sequences should be the shortest in any film of the familiar holiday. Given technical facilities, both can be combined and presented as a series of dissolve shots, great care being taken to avoid breaking the continuity with preceding and following sequences.

Activities.

In the suggested plan, four sequences have been devoted to holiday activities. Considering the length of vacations available to the average cinematographer and his friends, these may not appear sufficient; but the fact remains that holiday "action" is not varied so much as repeated—and the number of sequences suggested should not be exceeded except in warrantable circumstances.

There will be the usual glories of seabathing, the customary sunning on the sands, and the inevitable strolls along the promenade . . . also the ever-present temptation to film their types of action time and time again. Hence the need for adhering strictly to the plan and regarding as taboo any casual type of action as soon as its personification in suitable or concerned members of the party has been recorded.

Indeed, the high-spots of the film will develop in unusual action. A striking shot of father being swept overboard by the swinging boom of the *Saucy Skylark*, his happy rescue (effected not without some assistance from the pike-billed boat-hook), and his subsequent refusal to pay the apologetic owner represents a not-too-far fetched example of surprise footage available to any

Shots of beach action cannot be dispensed with in the seaside holiday film. The "characters" should be members of the family party and should not be aware of the presence o the camera.

cinematographer with an alert mind and a ready camera.

Action less painful but still of the same type presents itself immediately that little terrier comes back to worry mother at her knitting. These and a fair number of similar shots are there to lift the holiday film above the level of the mediocre. And whilst none of them can with any certainty of execution be included in the written plan, one can be tolerably sure of obtaining at least a few such shots before the holiday comes to a close.

Final Sequences.

Two further short sequences are represented in the leave-taking of new friends and the return home. The dissolve expedient should not be repeated here; nor is it sufficiently effective to close the film (as more than one experienced producer has done) with a fading shot of the home-coming train receding into the distance. After all, the home has a great attraction for the majority of people, and this attraction should be stressed as a means of preserving an entirely happy atmosphere even into the anti-climax of the film.

So the end should come, perfectly as the film began, in the home itself. Trite, pseudo-smarty titles should be avoided here; and whilst one does not care for hackneyed finales of the "And so to Bed" type, the theme is certainly applicable in the present instance. It can be worked out in several ways . . . but let the enthusiast improvise on these for himself.

I do not want the responsibility for another batch of "pull down the blind" films laid at my door!

Exhibitions and Competitions CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, July 31. Rules in the issue of June 24.

Wallace Heaton "35-mm. Film Competition." Cash prizes every week. Open to readers of *The Amateur Photographer* only. Full particulars in advertisement page in this issue.

XVme Salon International de Photographie de Bruxelles.—Open, May–October. (M. Maurice Broquet, Secretaire du Salon, Rue du Sceptre, 77, Brussels.)

Salon International de Fotografica de Madrid. (Señor Secretario de la Sociedad Fotografica de Madrid, Calle del Principe, 16, Madrid.)

Folkestone C.C. Competition in connection with Folkestone Floral Festival.—Open, July 8–18. Cash prizes. Entry forms available from photographic traders in Folkestone. (E. F. Davidson, 44, Wear Bay Crescent, Folkestone.)

The Listener. Cash prizes for photographs under general title "Conversation Pieces."—Open, July 8–August 25. Entries, Monday morning of each week. First selection in *The Listener* of July 22. (Editor, *The Listener*, Broadcasting House, London, W.1.)

Western Salon of Photography.—Open, July 11–18. (Rev. R. J. Attfield, Hennock Vicarage, Newton Abbot, Devon.)

Chicago International Salon.—Open, July 23–October 4. (Alex. J. Krupy, Chicago C.C., 137, North Wabash Avenue, Chicago, Ill.)

I International Kunstphotographische Austellung in Karlsbad.—Open, July 18–August 9. (Hugo Heyer, Schulgass, 26, Karlsbad.)

Thirteenth Midland Salon of Photography.—Open, June 20–July 18. (Geo. T. Boulton, The Art Gallery, Pall Mall, Hanley, Stoke-on-Trent, Staffs.)

XXXIe Salon International D'Arte Photographique de Paris.—Open, October 3–18. (M. E. Cousin, Secretaire de la Société Française de Photographique, 51, Rue de Clichy, Paris (9E).)

Radio Photo-Club de Spa. IVme Salon International de Photographie.—Entries, July 15; open, August 9–30. (M. René Chalsèche, Avenue Marie-Thérèse, 13, Spa, Belgium.)

I Salon Internacional de Fotografia de San Sebastian.—Entries, July 15; open, August 5–20. (Sr. Secretario General, I Salon Internacional de Fotografia de San Sebastian, Calle San Marcial, 26, San Sebastian, Spain.)

Forty-fifth Toronto Salon of Photography.—Entries, July 25; open, August 28–September 12. (W. H. Hammond, Secretary, Toronto Salon of Photography, 2, Gould Street, Toronto, Canada.)

Museum and Public Library, Maidstone. Exhibition of Nature Photography.—August 15–29. (C. E. Fisher, Museum and Public Library, Maidstone.)

Tweede "Focus" Fotosalon.—Entries, August 10; open, September 12–27. (Focus, Ltd., Fotosalon, Bloemendaal, The Netherlands.)

South African International Salon.—Entries, August 14; open, October. (Hon. Secretary, Johannesburg P.S., P.O. Box 7024, Johannesburg, South Africa.)

Royal Photographic Society Annual Exhibition.—Entries, August 14; foreign entries, July 31; open, September 12–October 10. (Secretary, R.P.S., 35, Russell Square, London, W.C.)

Buffalo C.C. Fourteenth Annual Salon of Photography.—Entries, August 15; open, September 6–27. (H. W. Schonewolf, 528, Elmwood Avenue, Buffalo, N.Y., U.S.A.)

Morecambe, Heysham and D.P.S.—Entries, August 19; open, September 9–16. (James F. Levisohn, B.Sc., 5, Douglas Drive, Heysham, Lancs.)

Fotoclub Zagreb. Fourth International Salon of Photography.—Entries, August 20; open, October. (Fotoclub Zagreb, Masarykova II, Zagreb, Yugoslavia.)

London Salon of Photography.—Entries, September 2; open, September 12–October 10. (Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

Lincoln Camera Club.—Entries, September 5; open, October 15–November 12. (Miss E. Redfern, 146, Burton Road, Lincoln.)

XII Salon International de Fotografica, Zaragoza, Spain.—Entries before September 10; open, October. (Secretary, Sociedad Fotografica de Zaragoza, Plaza de Sas, 7, Zaragoza, Spain.)

Third Canadian International Salon of Photographic Art.—Entries, September 10; open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, National Gallery of Canada, Ottawa, Canada.)

Windlesham C.C.—Entries, September 10; open, September 25–26. Classes for members (Beginners, Advanced, Professional, also Open Class). (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

IV International Hungarian Exhibition.—Entries, September 15; open, October 24–November 9. (Secretary, Magyar Amatörfényképezök, Orsz. Szövetsége, Budapest VII, Erzsébet-körut, 9, Hungary.)

Rotherham P.S. Forty-seventh Annual International Exhibition.—Entries, September 21; open, October 14–17. (E. George Alderman, Ruardean, Newton Street, Rotherham.)

Service Co. (London), Ltd. Happy Camp Snaps Competition. Cash prizes.—Entries, September 30. (Service Co. (London), Ltd., 273, High Holborn, London, W.C.1.)

Coronet Midget Camera Competition. Cash prizes.—Entries, September 30. (Coronet Camera Co., 310, Summer Lane, Birmingham, 19.)

Eighth International Photographic Salon of Japan.—Entries close in Tokyo, September 30; open, November (Tokyo and Osaka). (Sec., International Photographic Salon, Tokyo Asahi Shimbun, Tokyo, Japan.)

Johnson's "Holiday Competition. Cash prizes.—Closing date, October 31. (Johnson & Sons, Ltd., Hendon, N.W.4.)

U.P. International Exhibition of Photography, 1936 (Lucknow).—Entries, November 1; open, December 5, 1936–February 4, 1937. (Dr. K. N. Mathur, D.Sc., A.R.P.S., Hon. Sec., U.P. Amateur Photographic Association, Lucknow University, Lucknow.) Entry forms obtainable also from the Editor of *The Amateur Photographer*.

Tenth International Christmas Salon of Pictorial Photography (Antwerp).—Entries, November 15; open, December 20, 1936–January 3, 1937. (J. Van Dyck, Sec., Fotographische Kring "Iris," Ballaestr 69, Antwerp.)

A Prize Competition for Novices

THIS competition is specially for those readers of "The A.P." who are Novices; that is to say, amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups, or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

Our readers who are Novices have all the summer in which to make their prints for this competition, and the prizes are worth having.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.
The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.
The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.
Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 30th. This will give new readers who are Novices, and who intend entering this competition, every opportunity of improving their work during the next three months by reading *The Amateur Photographer* every week and obtaining their competition prints during the summer holidays.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

Further reference to the competition will be made week by week, and hints given for the best treatment of various subjects for Novices.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, July 8th.

Blackburn and D.C.C. Mr. Waddington's Competition. Last day for entries.
Borough Polytechnic P.S. Demonstration Competition.
Reading C.C. Visit to Messrs. Johnson's Works at Hendon.
Southampton C.C. Outing to Shawford. Misses Jones and Stubbs.

Thursday, July 9th.

Bedford C.C. Aspley Heath and Brickhill.
Bury P.S. Lantern-Slide Making.
Camberwell C.C. Open-Air Meeting: Brockwell Park. R. C. L. Herdson.
Hammersmith H.H.P.S. "Bromide Printing." C. B. Casson.
Medway A.P.A. Discussion at Camera Cottage, 7.30 p.m.
N. Middlesex P.S. "Mounting the Print." Rest Cartwright.
Nottingham and Notts P.S. Melbourne. C. P. Straw.
Oldham P.S. Evening Ramble: Tandle Hill. J. W. Ratcliffe.
Rochdale P.S. Trimming the Picture.
S. Suburban and Catford P.S. Outing to Dorking. H. Colebrook.
St. Helens C.C. Chadwick Green.

Friday, July 10th.

King's Heath and D.P.S. One-Man Portfolio. Landscapes (Bromoil). G. F. Prior.
Sheffield P.S. Moor Head: 7 p.m., Fox House. Mr. Hoyle.

Saturday, July 11th.

Accrington C.C. Reddisher Woods.
Armley and Wortley P.S. Ledsham and Ledston.
Beckenham P.S. Shoreham.
Bristol P.S. Old Sodbury and/or Dodington.
Bournemouth C.C. Throop. Throop Mill, 3 p.m.
Bradford P.S. Ilkley and "Yonville" Middleton.
Hull P.S. Driffield and District. R. E. Craggy.
Leeds C.C. Joint Outing with Doncaster C.C.
Letchworth C.C. Weston. Cycle or Motor. Harry Meyer.
Luton and D.C.C. Essendon. L.N.E.R., 1.3 p.m.
N. Middlesex P.S. Totteridge. C. E. Holdup.

Saturday, July 11th (*contd.*).

Northants N.H.S.P.S. Hazelborough Woods.
Norwood C.C. Greenwich. Greenwich Pier, 3 p.m.
Plymouth Inst. P.S. Opening of the Western Salon of Photography.
Rotherham P.S. Hooten Pagnell. A. E. Camp.
Sheffield P.S. Treak's Cavern, Castleton. L.M.S. Stn., 2.22 p.m.
S. London P.S. The City. A. R. Thomas.
St. Helens C.C. Hall Nook and Fiddler's Ferry.
Stockport P.S. Alderley to Prestbury. W. J. Parry.
Walthamstow and D.P.S. Oxshott. 3 p.m., Oxshott Station.

Sunday, July 12th.

B.P.F. Eynsford. (Victoria: Platform 6, 9.40 a.m.)
Blackburn and D.C.C. 12.10 Train to Gisburn.
Borough Polytechnic P.S. Ely. S. J. Gollop.
Ilford P.S. Croxley Green. Ilford Station, 10 a.m.
Medway A.P.A. Sevenoaks.
Nottingham and Notts P.S. Whipsnade Zoo. T. Finch.
S. Suburban and Catford P.S. Sevenoaks.
Wood Green P.S. Hertford.

Monday, July 13th.

Oldham Equitable P.S. Third Lantern-Slide Demonstration. J. Stubbins.
Southampton C.C. Amateur Portraiture Evening at the Club.
Walthamstow and D.P.S. Chingford Hatch. Meet: Wilfred Lawson.

Tuesday, July 14th.

Manchester A.P.S. Lecturettes, without slides.

Wednesday, July 15th.

Borough Polytechnic P.S. Jumble Sale.
Hackney P.S. Gadgets.
Northants N.H.S.P.S. Evening Walk: Harpole to Flore.
Rochdale P.S. "Some Pictures and Why They were Made." H. Gidman.
Stockport P.S. "Lecturettes" by Members.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. They are printed in either the vertical or horizontal form as shown here, and each is complete in itself.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 × 3, supplied for card index cabinets.

The collection when completed will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index, and are now ready. The size of the box is 5½ × 3½ × 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, S.E.1. Price 2s. 6d.

14. INTENSIFIERS

1.—Chromium.

A. Pot. bichromate	1 oz.	50 grm.
Water ..	20 oz.	1,000 c.c.
B. Pure hydrochloric acid ..	2 oz.	100 c.c.
Water to ..	20 oz.	1,000 c.c.

NEGATIVES can be treated immediately after fixing and washing, but if the negative has been dried it should be soaked in water for fifteen minutes before applying the intensifier.

The degree of intensification depends on the proportion of B in the mixed solution. The greater the quantity of acid the less the additional density gained.

For considerable intensification take of A, 2 oz.; B., ½ oz.; water, 10 oz.

For less intensification take of A, 2 oz.; B., 4 oz.; water, 10 oz.

The negative should be bleached right through in the solution and then thoroughly washed to remove all yellow stain.

It is then redeveloped in any non-staining alkaline developer, such as metol-hydroquinone, but with no bromide. The redevelopment should be conducted in white light. The process can be repeated if extra density is required.

The mixed bleaching solution will not keep, but A and B will remain unchanged indefinitely if kept separate.

For BROMIDE PRINTS that are weak in tone or of poor colour, the bleaching solution should be made up of A, 2 oz.; B, 6 oz., water, 10 oz. Redevelopment in M.Q. developer will then produce rich black tones of greater strength than by direct development. Still stronger tones can be secured by repeating the treatment, but if the original image is flat and veiled it should first be cleared with dilute "Farmer's Reducer" (see Formula 7), and well washed before applying the intensifier.

15. MAXIMUM EXPOSURES FOR MOVING OBJECTS

(*F. S. BAWTREE.*)

THE following shutter exposures are calculated to give a maximum movement of 1/100th in. on the focussing screen or focal plane (film or plate) with 5-in. lens on quarter-plate.

Object moving M.P.H.	Yards per second.	At 25 yards. Across Field of Film or Plate.	To or from, at angle of 45°	To or from, head on.	At 50 yards across field of film or plate.
		sec.	sec.	sec.	sec.
60	30	1/720	1/480	1/360	1/360
40	20	1/480	1/330	1/240	1/240
30	15	1/360	1/240	1/180	1/180
20	10	1/240	1/160	1/120	1/120
10	5	1/120	1/80	1/60	1/60
5	2½	1/160	1/40	1/30	1/30
2	1	1/24	1/16	1/12	1/12
1	½	1/12	1/8	1/6	1/6

The shutter speeds should be set to the nearest available fraction of a second to those calculated in the above table, *but are not necessarily the correct exposures for the plate or film.*

With a 2½-in. lens on a smaller plate or film the shutter times given above can be doubled to secure the same effect.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Film Speeds.

I have been advised that it is best for exposure meter purposes to assume that all films are a little slower than their advertised speeds. Is this correct? A. C. W. (Shrewsbury.)

The whole question of the speed numbers of sensitive material is in such hopeless confusion that it is impossible to pass any opinion upon such a point as you raise. Personally, we should think it wise to keep on the safe side by assuming that a plate or film is slower than it is advertised to be.

Shutter Construction.

Where can I obtain books dealing with design and constructions of various lens shutters? H. A. (Leamington Spa.)

There is no book available that deals with the construction and working of all the shutters available. The Compur is one of the most efficient and reliable of modern shutters, and, if you get a camera with one of these fitted, you need not worry yourself about its construction.

Markets for Photographs.

Spending much of my time travelling, I have collected many snapshots and am thinking of selling these and future prints. As I use only a —— roll-film camera, what camera do you suggest would give better results and be more suitable for travelling? H. G. A. (Devon.)

Within reason, the actual camera you use is a matter of but small importance. A far greater problem would be to find a market for your prints. The supply is now so great that a print has to be of very special interest to stand any chance of acceptance. We think your best plan would be to see how you get on with larger prints made with your present camera, and, if you meet with any success, it might then be worth your while to consider the purchase of another instrument. Although the technique of each photograph should be as good as possible, it is mainly the subject matter that sells the print.

Focussing by Scale.

At what point on the camera is the starting point for measuring the various distances on the engraved scale? Is it the film or the front of the lens? J. B. (London.)

Strictly speaking, the distance should be measured from the diaphragm inside the lens, but it will be sufficiently accurate if you measure the distances from the front of the lens. It should not be measured from the focal plane of the camera, the position of the film.

Camera and Enlarger.

I am thinking of purchasing a half-plate camera and condenser to make up an enlarger. Do you think this will make a satisfactory job? W. L. A. (Manchester.)

It is quite impossible for us to pass any opinion as to the suitability of the camera as part of an enlarger. To cover a half-plate negative the condenser would have to be 8½ in. in diameter, and such a condenser would cost more than you are asked for the whole outfit. The focal length of the lens must approximate to that of the condenser, and if you enlarge from smaller negatives you will be wasting most of the light, and the distance required will be inconveniently great. On the whole we should not recommend the proposition as a satisfactory one, particularly if only small negatives were being enlarged.

Stage Photography.

Can you give me some approximate idea of exposure for taking various groups on a stage with full stage lighting? What is the usual procedure regarding selling prints for private and reproduction purposes? A. G. (London.)

In reply to your enquiry, the question of lighting is the doubtful factor in your case, as this may vary enormously, and will obviously affect the exposure. If, however, by "ordinary stage lighting," which you mention, the full range of lights are on, with possibly spot lights (not coloured lighting), exposures of one to two seconds should be sufficient with the lens aperture of f/4.5, and speed of panchromatic plate you mention. If the lighting is coloured, or less than what you may regard as normal, it may need two to four seconds. It is assumed that you will be moderately close to the stage when taking the pictures, as the greater the distance from the stage and the lighting the longer the exposure will be. An average of two seconds would probably give you fully-exposed negatives. The usual course is either to charge a fee for the work and a nominal sum for each of the prints, or to charge nothing for undertaking the work, but ask a higher price for original prints, up to, say, 10s. 6d. each. For this sum they should be enlarged above the contact size. You should, of course, make it clear that you retain the copyright, so that you may also sell the prints for reproduction if necessary.

Marks on Negatives.

What do you suggest is the cause of the circular rings on the enclosed negatives? The camera is of the twin-lens reflex type, 2¼ in. square, which is always kept in an ever-ready case with the red window protected with black tape, so that it is not a question of light leakage. It has happened before with a V.P. camera, and again the window was protected. T. T. (Birmingham.)

From the particulars you give we are unable to identify the cause of the trouble. It is possibly not due to light at all, but to the numbers setting off on the film, especially in the presence of damp. This sometimes occurs when the printing ink on the numbers comes off and is transferred to the adjacent emulsion when the film is rolled up tightly.

Over-corrected Greens on Panchromatic Film.

How can I prevent the greens from appearing too light, almost white, in my prints? I am using panchromatic film. F. S. (London.)

We do not see any reason why the greens in your subjects should be out of tone or over-corrected with panchromatic film. This is assuming that your exposure and development are reasonably correct. Otherwise, it will be necessary to use a correcting colour filter, and a very light orange filter should meet the case. If you could send us an example of what you consider unnatural tone or colour values, we might be able to pass an opinion upon it.

Photographic Clubs.

Will you kindly send me the address of the nearest club to this locality? C. T. M. (Manchester.)

The two best-known societies in your locality are the Manchester Amateur Photographic Society, the Secretary of which is Mr. H. Chapman, 34, Radstock Road, Stretford, Nr. Manchester; and the Manchester Photographic Society, the Secretary being Mr. W. Rigby, 29, Lindsay Street, Salford, 5, Lancs. If you apply to the Secretaries at the addresses given, all the particulars will be sent to you.

REASONS WHY, IF WE WERE YOU, WE WOULD BUY OUR MINIATURE CAMERA FROM US

As things are, when we want to use a camera for any particular purpose, we just wander down to our second-hand stock cupboard and make our care-free selection from among the ranks that line its shelves. Were positions, however, reversed, and we had to buy our camera like any other amateur, we should unhesitatingly buy it from the firm of R. G. Lewis.

We should go as automatically to the miniature camera specialist for our miniature camera as we would to a throat doctor in preference to an alienist for our tonsils. It would also occur to us that a small and compact firm operating at one address only would be more likely to be INTERESTED in us and in our requirements, than a large and impersonal company. We should also be favourably influenced by a method of advertising that is not indistinguishable in make-up and sentiment from every other advertisement.

In all these suppositions and surmises we should, of course, be correct, and it is only a pity that as an ordinary member of the public we should be deprived of the inside information—the decisive evidence—which we now possess regarding the general excellence of the firm of R. G. LEWIS.

THE FOLLOWING LIST REPRESENTS A SELECTION OF USED MINIATURE CAMERAS FROM OUR STOCK. WE HAVE, BESIDES THESE, THE MOST COMPREHENSIVE COLLECTION OF NEW MINIATURE CAMERAS AND ACCESSORIES TO BE FOUND IN GREAT BRITAIN. OVER FIVE HUNDRED DIFFERENT ACCESSORIES FOR THE LEICA CAMERA ONLY ARE TO BE SEEN AT OUR SHOWROOMS

WITH EACH OF THE SECOND-HAND CAMERAS LISTED BELOW WE GIVE A WRITTEN GUARANTEE OF MECHANICAL AND OPTICAL PERFECTION.

LEICAS:

Leica Model IIIa, fitted latest pattern rectilinear focussing f/1.9 Hektor. Unsoiled in any way £45 0 0
Leica Model IIIa, f/2 Summar lens, ever-ready case. As new £34 10 0
Leica Model III, chromium, f/2 Summar lens, ever-ready case. As new £31 10 0
Leica Model III, black, f/2 Summar lens, ever-ready case. Excellent condition £30 10 0
Leica Model II, black, f/2 Summar lens. As new £27 15 0
Leica Model II, black, f/2.5 Hektor lens. As new £22 10 0
Leica Model II, black, f/3.5 Elmar, ever-ready case. As new £19 10 0
Leica Standard Model, f/3.5 Elmar lens, ever-ready case. As new £11 17 6
Leica Model I, f/3.5 Elmar lens, non-interchangeable. Good condition £8 5 0
Leitz 3.5-cm. f/3.5 Elmar, chromium £6 15 0
Leitz 7.3-cm. f/1.9 Hektor, coupled (non-rectilinear). Excellent condition £18 10 0
Leitz 7.3-cm. f/1.9 Hektor, coupled, rectilinear focussing. As new £21 0 0
Leitz 13.5-cm. f/4.5 Elmar Lens, coupled. As new £11 17 6
Leitz 13.5-cm. f/4.5 Elmar Lens, uncoupled. Good condition £7 5 0
Leitz 13.5-cm. f/4.5 Hektor Lens, coupled. As new £13 10 0
15-cm. f/2.3 Astro Identoscope Telephoto Lens, for Leica, with magnifier and reflex attachment. Listed £95. As new £67 10 0
2.8-cm. Hektor f/6.3 ..... £8 17 6
Vidom View-finder, chromium £3 3 0
Leitz Synchroflash Attachment £3 5 0

CONTAXES:

Contax Model I, wedge-type range-finder, f/1.5 Sonnar lens, ever-ready case. As new £42 10 0
Contax, as above, but with f/2 Sonnar lens £37 17 6
Contax, as above, but with f/2.8 Tessar lens £25 17 6
Contax, as above, but with f/3.5 Tessar lens £23 17 6
(We can supply the Contax Model I with the improved slow-speeds shutter, but the earlier type range-finder, at a reduction of £3 10s. on each of the above prices.)
Zeiss 18-cm. f/6.3 Tele-Tessar, for Contax. As new £20 10 0
Zeiss 12-in. f/8 Tele-Tessar, with filter and special case. Cost £48. As new £30 0 0
Zeiss 13.5-cm. f/4 Sonnar, for Contax. Excellent condition £16 15 0

MISCELLANEOUS:

Multispeed Exakta, f/2.9 Dallmeyer Pentac lens, case. Good condition £17 15 0
Exakta Model A, f/3.5 Tessar lens, case. As new £13 17 6
Model A Exakta, f/2.8 Tessar lens, case. Good condition £17 15 0
Model A Exakta, f/3.5 Exaktar lens, case. Good condition £11 10 0
Contaflex, f/2 Sonnar, ever-ready case. As new £55 0 0
Automatic Rolleiflex, 6×6, f/3.8 Tessar, ever-ready case. Excellent condition £16 15 0
Rolleicord, f/3.8 Triotar lens, ever-ready case. As new £11 17 6
Rolleicord, f/4.5 Triotar, case. As new £8 15 0
Automatic Rolleiflex, 4×4, f/2.8 Tessar, latest type, normal Compur, ever-ready case. Indistinguishable from new £17 10 0
Automatic Rolleiflex, 6×6, f/3.5 Tessar, ever-ready case. As new £20 10 0
Foth-Flex, 6×6 cm., latest slow-speeds model, f/3.5 lens. As new £7 17 6
Zeiss Super Ikonta, 530/16, f/3.5 Tessar, Rapid Compur. As new £19 17 6
Zeiss Super Ikonta, 530/LCPR, f/3.5 Tessar, Rapid Compur, ever-ready case. As new £14 17 6
Zeiss Super Ikonta, 3½×2½, f/3.8 Tessar, case. Cost £24. As new £19 10 0
Planovista, V.P. size, f/2.7 Macro Plasmat. As new £11 15 0
Planovista, f/3.5 Trioplan. As new £8 15 0
Rubyette, f/4.5 Dallmeyer, roll-film adapter and 3 slides. As new £8 7 6
Zeiss Ikonta 520, f/3.5 Tessar, Compur. As new £8 7 6
3½×2½ Etui, f/3.9 Supracomar, Compur, F.P. adapter, 6 slides. New condition £9 15 0
Kodak Nagel Six-20 Duo, f/3.5 Kodak lens, Compur shutter, 2 filters and case. As new £7 17 6
Nagel Rolloroy, f/2 Xenon lens, case. Good condition £12 10 0
Kodak Pupille, f/3.5 Xenar, special reflex attachment. Good condition £9 15 0

SOMETHING NEW

Simplex Daylight Loading Tank, for 3½×2½ negatives £1 17 6
Teitel Scratch-proof Solution. Per bottle ..... 5s. 0d.
Teitel "New Life" Preparation. Per bottle ..... 5s. 0d.
"Meritol," Johnson's new super fine-grain developer. Keeps excellently both in its crystalline form or in solution, 20 oz. 2s. 0d.; 40 oz. 3s. 6d.

SUPER FINE-GRAIN DEVELOPERS:

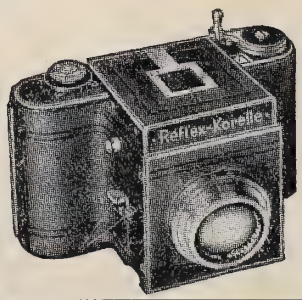
LEICANOL, the latest German fine-grain compensating developer. Requires no increase whatever in exposure. Each 2s. tin makes 20 oz., and is sufficient to develop 6 Leica films.
TETENAL ULTRAFIN SS. Claimed as surpassing paraphenylene in the production of fine-grain negatives. Price 4s. per carton.
PARAPHENYLENE-GLYCIN. Our own formula. Especially suitable for portraiture. Price 1s. 2d. per tin, making 20 oz.
BUFFERED BORAX. Perhaps the most popular "all-round" fine-grain developer. Price 1s. per tin.
ACID STOP BATH AND HARDENER. Our own formula. 3s. per dozen packets.

R. G. LEWIS, The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1
(HOLBORN 4780) (Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

THIRD EDITION —*Revised throughout*

PHOTOGRAPHY MADE EASY

By R. CHILD BAYLEY



By careful study of this book the novice with a camera will be able to get a greater proportion of successful photographs than would usually be the case. It should form as much a part of the outfit as the camera itself.

Price 2/- net By Post 2/3

Obtainable from all leading booksellers, or direct by post from the Publishers

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS :

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue : 13 consecutive insertions, 5% ; 26 consecutive, 10% ; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry ; Guildhall Buildings, Navigation Street, Birmingham, 2 ; 260, Deansgate, Manchester, 3 ; 26B, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o "The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.
